## New Foreword

On October 1, 2001 Axiom was withdrawn from the market and ended life as a commercial product. On September 3, 2002 Axiom was released under the Modified BSD license, including this document. On August 27, 2003 Axiom was released as free and open source software available for download from the Free Software Foundation's website, Savannah.

Work on Axiom has had the generous support of the Center for Algorithms and Interactive Scientific Computation (CAISS) at City College of New York. Special thanks go to Dr. Gilbert Baumslag for his support of the long term goal.

The online version of this documentation is roughly 1000 pages. In order to make printed versions we've broken it up into three volumes. The first volume is tutorial in nature. The second volume is for programmers. The third volume is reference material. We've also added a fourth volume for developers. All of these changes represent an experiment in print-on-demand delivery of documentation. Time will tell whether the experiment succeeded.

Axiom has been in existence for over thirty years. It is estimated to contain about three hundred man-years of research and has, as of September 3, 2003, 143 people listed in the credits. All of these people have contributed directly or indirectly to making Axiom available. Axiom is being passed to the next generation. I'm looking forward to future milestones.

With that in mind I've introduced the theme of the "30 year horizon". We must invent the tools that support the Computational Mathematician working 30 years from now. How will research be done when every bit of mathematical knowledge is online and instantly available? What happens when we scale Axiom by a factor of 100, giving us 1.1 million domains? How can we integrate theory with code? How will we integrate theorems and proofs of the mathematics with space-time complexity proofs and running code? What visualization tools are needed? How do we support the conceptual structures and semantics of mathematics in effective ways? How do we support results from the sciences? How do we teach the next generation to be effective Computational Mathematicians?

The "30 year horizon" is much nearer than it appears.

Tim Daly

# Chapter 1

## Overview

This book covers 5 top level commands that make up the Axiom Hyperdoc browser. The primary command is the hypertext command which can be run as a standalone program to browse the Axiom documentation. It can also be run by Axiom to enable lookup of information in the Axiom runtime.

## 1.1 The Original Plan

The Original Hypertext Plan (courtesy of Scott Morrison)

## 1.2 External Variables

Not mentioned elsewhere,

- the HTPATH shell variable, if set, is used to resolve page path names.
- the HTASCII shell variable, if set, is used to choose between ascii and the IBM Code Page 850 character set. See [initScanner 5.4.2](#) on page [130](#)
- the XENVIRONMENT shell variable, if set is used to find the X database to merge, otherwise it uses .Xdefaults from the HOME directory. See [11.17.14](#) on page [354](#)
- NOFREE shell variable is supposed to turn off freeing memory. See [11.22.10](#) on page [380](#)
- SPADNUM shell variable is the number of the spad communication socket. See [11.30.2](#) on page [470](#)

The Axiom user properties in `$HOME/.Xdefaults.` can contain these initialization names:

- Axiom.hyperdoc.FormGeometry
- Axiom.hyperdoc.Geometry
- Axiom.hyperdoc.ActiveColor
- Axiom.hyperdoc.Background
- Axiom.hyperdoc.EmphasizeColor
- Axiom.hyperdoc.EmphasizeFont
- Axiom.hyperdoc.Foreground
- Axiom.hyperdoc.InputBackground
- Axiom.hyperdoc.InputForeground
- Axiom.hyperdoc.SpadColor
- Axiom.hyperdoc.SpadFont
- Axiom.hyperdoc.RmFont
- Axiom.hyperdoc.TtFont
- Axiom.hyperdoc.ActiveFont
- Axiom.hyperdoc.AxiomFont
- Axiom.hyperdoc.SpadFont
- Axiom.hyperdoc.EmphasizeFont
- Axiom.hyperdoc.BoldFont
- Axiom.hyperdoc.Font

## 1.3 hypertex

Usage: `hypertex [-s]`

## 1.4 htsearch

Construct a page with a menu of references to the word. The syntax of the command is:

Usage: `htsearch word`

## 1.5 spadbuf

Usage: `spadbuf page_name [completion_files]`

## 1.6 hthits

Usage: `hthits pattern htodb-file`

## 1.7 ex2ht

Usage: `ex2ht exfile.ht ...`

## 1.8 htadd

HyperDoc database file manager

Usage: `htadd [-s|-l|-f db-directory] [-d|-n] filenames`

## Chapter 3

# Hypertext Call Graph

This was generated by the GNU cflow program with the argument list. Note that the line:NNNN numbers refer to the line in the code after it has been tangled from this file.

```
cflow --emacs -l -n -b -T --omit-arguments hypertex.c
```

```
;; This file is generated by GNU cflow 1.3. -*- cflow -*-

# Chapter 4

## include

This chapter contains the include files. Unlike normal C programs we replace the 'include' directive by the actual chunk from this chapter. The results are that the include files never get written to disk and the compiler never sees the include directive, resulting in faster compile times.

The include files are collected from both the view\* programs and the low level C code that supports them, including libspad which, in general, have the file extension of 'h1' rather than 'h'.

### 4.1 include/actions.h

— include/actions.h —

```

## Chapter 5

# Shared Code

### 5.0.1 BeStruct

```
— BeStruct —  
typedef struct be_struct {  
    int type;  
    char *id;  
    struct be_struct *next;  
} BeStruct;  
  
BeStruct *top_be_stack;
```

---

## 5.1 Shared Code for file handling

### 5.1.1 strpostfix

```
— strpostfix —  
static int strpostfix(char *s, char *t) {  
    int slen = strlen(s), tlen = strlen(t);  
    if (tlen > slen)  
        return 0;  
    while (tlen > 0)  
        if (s[--slen] != t[--tlen])  
            return 0;  
    return 1;  
}
```

---

### 5.1.2 extendHT

If the filename does not end with the string “.pamphlet”, or “.ht”, or “.pht”, then add “.ht” as the default. System pages live in the bookvol7.1.pamphlet file but user pages can live in .ht files. The .pht files are the “paste” files which are cached results of computations available when hyperdoc is running without Axiom.

For system pages we hand generate the paste files and add them to the hyperdoc volume.

— **extendHT** —

```
void extendHT(char *name) {
    if (!strpostfix(name, ".pamphlet") &&
        !strpostfix(name, ".ht") &&
        !strpostfix(name, ".pht"))
        strcat(name, ".ht");
    return;
}
```

—————

### 5.1.3 buildHtFilename

This procedure is sent a filename, and from it tries to build the full filename, this it returns in the fullname variable. If the file is not found, then it returns a -1. The fname is the fullpath name for the file, including the .ht extension. The aname is the filename minus the added .ht extension, and the pathname.

— **buildHtFilename** —

```
static int buildHtFilename(char *fname, char *aname, char *name) {
    char cdir[256];
    char *c_dir;
    char *HTPATH;
    char *trace;
    char *trace2;
    int ht_file;
    if (cwd(name)) {
        /* user wants to use the current working directory */
        c_dir = (char *) getcwd(cdir, 254);
        strcpy(fname, c_dir);
        /* Now add the rest of the filename */
        strcat(fname, "/");
        strcat(fname, &name[2]);
        /** now copy the actual file name to addname **/
        for (trace = &name[strlen(name)]; trace != name &&
            (*trace != '/'); trace--);
        if (trace == name) {
            fprintf(stderr, "ht_open_file: Didn't expect a filename like %s\n",
                name);
            exit(-1);
        }
        trace++;
        strcpy(aname, trace);
    }
```

```

    /** add the .ht extension if needed */
    extendHT(aname);
    extendHT(fname);
    /*fprintf(stderr,
        "TPDHERE:ht_open_file:2: name=%s aname=%s fname=%s\n",
        name,aname,fname); */

        *trace = 0;
        if (!strcmp(fname, ".")) {
            /** The person wishes me to check the current directory too **/
            getcwd(fname, 256);
            strcat(fname, "/");
        }
        if (*trace2)
            trace2++;
        strcat(fname, aname);
        ht_file = access(fname, R_OK);
    }
    return (ht_file);
}
}

```

---

#### 5.1.4 pathname

— pathname —

```

static int pathname(char *name) {
    while (*name)
        if (*name++ == '/')
            return 1;
    return 0;
}

```

---

#### 5.1.5 htFileOpen

This procedure opens the proper HT file

— htFileOpen —

```

FILE *htFileOpen(char *fname, char *aname, char *name) {
    FILE *ht_fp;
    int ret_value;
    ret_value = buildHtFilename(fname, aname, name);
    if (ret_value == -1) {
        fprintf(stderr, "htFileOpen: Unknown file %s\n", fname);
        exit(-1);
    }
    ht_fp = fopen(fname, "r");
    if (ht_fp == NULL) {
        perror("htFileOpen");
        exit(-1);
    }
    return (ht_fp);
}

```

### 5.1.6 dbFileOpen

This function is responsible for actually opening the database file. For the moment it gets the \$AXIOM environment variable, and appends to it "doc/ht.db", and then opens it

Modified on 12/3/89 to take a second argument. This argument tells the open routine whether it is reading the db file, or writing it. If writing is true, then I should check to insure I have proper write access. -JMW

Modified again on 12/9/89 so that it now uses HTPATH as the path name. Now it initially loads up the path name into a static variable. Then upon every trip, it gets the next ht.db found. It returns NULL when no ht.db is found. -JMW

#### — dbFileOpen —

```
FILE *dbFileOpen(char *dbFile) {
    static char *db_path_trace = NULL;
    char *dbFile_trace;
    FILE *db_fp;
    char *spad;
    /*
     * The first time through is the only time this could be true. If so, then
     * create the default HTPATH for gDatabasePath.
     */
    /*fprintf(stderr,"addfile:dbFileOpen: entered dbFile=%s\n",dbFile);*/
    if (gDatabasePath == NULL) {
        gDatabasePath = (char *) getenv("HTPATH");
        if (gDatabasePath == NULL) {
            spad = (char *) getenv("AXIOM");
            if (spad == NULL) {
                fprintf(stderr,
                    "addfile:dbFileOpen: Cannot find ht data base path:\n");
                exit(-1);
            }
            gDatabasePath = (char *) malloc(sizeof(char) * 1024, "dbFileOpen");
            strcpy(gDatabasePath, spad);
            strcat(gDatabasePath, "/doc");
        }
        db_path_trace = gDatabasePath;
    }
    /*fprintf(stderr,"addfile:dbFileOpen: db_path_trace=%s\n",db_path_trace);*/
    /*
     * Now Loop until I find one with okay filename
     */
    for (db_fp = NULL; db_fp == NULL && *db_path_trace != '\0';) {
        for (dbFile_trace = dbFile; *db_path_trace != ':' &&
            *db_path_trace != '\0'; db_path_trace++)
            *dbFile_trace++ = *db_path_trace;
        *dbFile_trace = '\0';
    }
}
```

```

        strcat(dbFile_trace, "/ht.db");
/*  fprintf(stderr,"addfile:dbFileOpen: dbFile_trace=%s\n",dbFile_trace); */
/*  fprintf(stderr,"addfile:dbFileOpen: dbFile=%s\n",dbFile); */
        db_fp = fopen(dbFile, "r");
        if (*db_path_trace != '\0')
            db_path_trace++;
    }
/*
    if (db_fp == NULL)
        fprintf(stderr,"addfile:dbFileOpen: exit (null)\n");
    else
        fprintf(stderr,"addfile:dbFileOpen: exit opened\n");
*/
    return (db_fp);
}

```

---

### 5.1.7 tempFileOpen

— tempFileOpen —

```

FILE *tempFileOpen(char *temp_dbFile) {
    FILE *temp_db_fp;
    /** Just make the name and open it **/
    strcpy(temp_dbFile, temp_dir);
    strcat(temp_dbFile, "ht2.db" /* dbName */ );
    temp_db_fp = fopen(temp_dbFile, "w");
    if (temp_db_fp == NULL) {
        perror("tempFileOpen");
        exit(-1);
    }
    return temp_db_fp;
}

```

---

## 5.2 Shared Code for Hash Table Handling

### 5.2.1 halloc

Allocate memory and bomb if none left (HyperDoc alloc)

— halloc —

```

char *halloc(int bytes, char *msg) {
    static char buf[200];
    char *result;
#ifdef DEBUG
    static int first = 1;
    if (first) {
        fp = fopen("/tmp/hallocs", "w");

```

```

        first = 0;
    }
#endif
    result = (char *) malloc(bytes);
#ifdef DEBUG
    fprintf(fp, "%d\tAllocating %d Bytes for %s\n", result, bytes, msg);
#endif
    if (result == NULL) {
        sprintf(buf, "Ran out of memory allocating %s.\b", msg);
        fprintf(stderr, "%s\n", buf);
        exit(-1);
    }
    return result;
}

```

---

### 5.2.2 hashInit

Initialize a hash table.

— **hashInit** —

```

void hashInit(HashTable *table, int size, EqualFunction equal,
              HashcodeFunction hash_code) {
    int i;
    table->table =
        (HashEntry **) hallocc(size * sizeof(HashEntry *), "HashEntry");
    for (i = 0; i < size; i++)
        table->table[i] = NULL;
    table->size = size;
    table->equal = equal;
    table->hash_code = hash_code;
    table->num_entries = 0;
}

```

---

### 5.2.3 freeHash

— **freeHash** —

```

void freeHash(HashTable *table, FreeFunction free_fun) {
    if (table) {
        int i;
        for (i = 0; i < table->size; i++) {
            HashEntry *e, *next;
            for (e = table->table[i]; e != NULL;) {
                next = e->next;
                (*free_fun) (e->data);
                (*e).data=0;
                free(e);
                e = next;
            }
        }
    }
}

```

```

    }
}
free(table->table);
}
}

```

---

### 5.2.4 hashInsert

Insert an entry into a hash table.

— hashInsert —

```

void hashInsert(HashTable *table, char *data, char *key) {
    HashEntry *entry = (HashEntry *) malloc(sizeof(HashEntry), "HashEntry");
    int code;
    entry->data = data;
    entry->key = key;
    code = (*table->hash_code) (key, table->size) % table->size;
#ifdef DEBUG
    fprintf(stderr, "Hash value = %d\n", code);
#endif
    entry->next = table->table[code];
    table->table[code] = entry;
    table->num_entries++;
}

```

---

### 5.2.5 hashFind

— hashFind —

```

char *hashFind(HashTable *table, char *key) {
    HashEntry *entry;
    int code = table->hash_code(key, table->size) % table->size;
    for (entry = table->table[code]; entry != NULL; entry = entry->next)
        if ((*table->equal) (entry->key, key))
            return entry->data;
    return NULL;
}

```

---

### 5.2.6 hashReplace

— hashReplace —

```

char *hashReplace(HashTable *table, char *data, char *key) {

```

```

HashEntry *entry;
int code = table->hash_code(key, table->size) % table->size;

for (entry = table->table[code]; entry != NULL; entry = entry->next)
    if ((*table->equal) (entry->key, key)) {
        entry->data = data;
        return entry->data;
    }
return NULL;
}

```

---

### 5.2.7 hashDelete

— hashDelete —

```

void hashDelete(HashTable *table, char *key) {
    HashEntry **entry;
    int code = table->hash_code(key, table->size) % table->size;
    for (entry = &table->table[code]; *entry != NULL; entry=&((*entry)->next))
        if ((*table->equal) ((*entry)->key, key)) {
            *entry = (*entry)->next;
            table->num_entries--;
            return;
        }
}

```

---

### 5.2.8 hashMap

— hashMap —

```

void hashMap(HashTable *table, MappableFunction func) {
    int i;
    HashEntry *e;
    if (table == NULL)
        return;
    for (i = 0; i < table->size; i++)
        for (e = table->table[i]; e != NULL; e = e->next)
            (*func) (e->data);
}

```

---

### 5.2.9 hashCopyEntry

— hashCopyEntry —

```
HashEntry *hashCopyEntry(HashEntry *e) {
    HashEntry *ne;
    if (e == NULL)
        return e;
    ne = (HashEntry *) malloc(sizeof(HashEntry), "HashEntry");
    ne->data = e->data;
    ne->key = e->key;
    ne->next = hashCopyEntry(e->next);
    return ne;
}

/* copy a hash table */
```

---

### 5.2.10 hashCopyTable

— hashCopyTable —

```
HashTable *hashCopyTable(HashTable *table) {
    HashTable *nt = (HashTable *) malloc(sizeof(HashTable), "copy hash table");
    int i;
    nt->size = table->size;
    nt->num_entries = table->num_entries;
    nt->equal = table->equal;
    nt->hash_code = table->hash_code;
    nt->table = (HashEntry **) malloc(nt->size * sizeof(HashEntry *),
                                      "copy table");
    for (i = 0; i < table->size; i++)
        nt->table[i] = hashCopyEntry(table->table[i]);
    return nt;
}
```

---

### 5.2.11 stringHash

Hash code function for strings.

— stringHash —

```
int stringHash(char *s, int size) {
    int c = 0;
    char *p = s;
    while (*p)
        c += *p++;
    return c % size;
}
```

---

### 5.2.12 stringEqual

Test strings for equality.

— **stringEqual** —

```
int stringEqual(char *s1, char *s2) {
    return (strcmp(s1, s2) == 0);
}
```

---

### 5.2.13 allocString

Make a fresh copy of the given string.

— **allocString** —

```
char *allocString(char *str) {
    char * result;
    result = malloc(strlen(str)+1,"String");
    strcpy(result,str);
    return (result);
}
```

---

## 5.3 Shared Code for Error Handling

### 5.3.1 jump

— **jump** —

```
void jump(void) {
    if (gWindow == NULL)
        exit(-1);
    longjmp(jmpbuf, 1);
    fprintf(stderr, "(HyperDoc) Long Jump failed, Exiting\n");
    exit(-1);
}
```

---

### 5.3.2 dumpToken

We need a function to print the token object for debugging.

To use this function the caller provides its own name and the token to be printed. For instance, a call would look like:

```
dumpToken("fname", token)
```

There is no return value.

— **dumpToken** —

```
void dumpToken(char *caller, Token t) {
    fprintf(stderr, "TPDHERE:%s:dumpToken type=%s id=%s\n",
        caller, token_table[t.type], t.id);
}
```

---

### 5.3.3 printPageAndFilename

— **printPageAndFilename** —

```
void printPageAndFilename(void) {
    char obuff[128];
    if (gPageBeingParsed->type == Normal) {
        /*
         * Now try to inform the user as close to possible where the error
         * occurred
         */
        sprintf(obuff,
            "(HyperDoc) While parsing %s on line %d\n\tin the file %s\n",
            gPageBeingParsed->name, line_number,
            gPageBeingParsed->filename);
    }
    else if (gPageBeingParsed->type == SpadGen) {
        sprintf(obuff, "While parsing %s from the Spad socket\n",
            gPageBeingParsed->name);
    }
    else if (gPageBeingParsed->type == Unixfd) {
        sprintf(obuff, "While parsing %s from a Unixpipe\n",
            gPageBeingParsed->name);
    }
    else {
        /* Unknown page type */
        sprintf(obuff, "While parsing %s\n", gPageBeingParsed->name);
    }
    fprintf(stderr, "%s", obuff);
}
```

---

### 5.3.4 printNextTenTokens

— **printNextTenTokens** —

```
void printNextTenTokens(void) {
    int i;
```

```

int v;
fprintf(stderr, "Trying to print the next ten tokens\n");
for (i = 0; i < 10; i++) {
    v = getToken();
    if (v == EOF)
        break;
    printToken();
}
fprintf(stderr, "\n");
}

```

---

### 5.3.5 printToken

Print out a token value.

— **printToken** —

```

void printToken(void) {
    if (token.type == Word)
        printf("%s ", token.id);
    else {
        tokenName(token.type);
        printf("\\\\%s ", ebuffer);
    }
    fflush(stdout);
}

```

---

### 5.3.6 tokenName

— **tokenName** —

```

void tokenName(int type) {
    if (type <= NumberUserTokens)
        strcpy(ebuffer, token_table[type]);
    else {
        switch (type) {
            case Lbrace:
                strcpy(ebuffer, "{");
                break;
            case Rbrace:
                strcpy(ebuffer, "}");
                break;
            case Macro:
                strcpy(ebuffer, token.id);
                break;
            case Group:
                strcpy(ebuffer, "{");
                break;
        }
    }
}

```

```

    case Pound:
        strcpy(ebuffer, "#");
        break;
    case Lsquarebrace:
        strcpy(ebuffer, "[");
        break;
    case Rsquarebrace:
        strcpy(ebuffer, "]");
        break;
    case Punctuation:
        strcpy(ebuffer, token.id);
        break;
    case Dash:
        strcpy(ebuffer, token.id);
        break;
    case Verbatim:
        strcpy(ebuffer, "\\begin{verbatim}");
        break;
    case Scroll:
        strcpy(ebuffer, "\\begin{scroll}");
        break;
    case Dollar:
        strcpy(ebuffer, "$");
        break;
    case Percent:
        strcpy(ebuffer, "%");
        break;
    case Carrot:
        strcpy(ebuffer, "^");
        break;
    case Underscore:
        strcpy(ebuffer, "_");
        break;
    case Tilde:
        strcpy(ebuffer, "~");
        break;
    case Cond:
        sprintf(ebuffer, "\\%s", token.id);
        break;
    case Icorrection:
        strcpy(ebuffer, "\\(/");
        break;
    case Paste:
        strcpy(ebuffer, "\\begin{paste}");
        break;
    case Patch:
        strcpy(ebuffer, "\\begin{patch}");
        break;
    default:
        sprintf(ebuffer, " %d ", type);
}
/*return 1;*/
}
}

```

---

### 5.3.7 htperror

This is the error handling routine in AXIOM. The main routine is called `htperror()`: arguments: `msg` - like `perror` it accepts an error message to be printed `errno` - the `errno` which occurred. This is so an appropriate error message can be printed.

It prints out the page name, and then the filename in which the error occurred. If possible it also tries to print out the next ten tokens.

— **htperror** —

```
void tpderror(char *msg, int errno) {
    char obuff[256];
    /* The first thing I do is create the error message */
    if (errno <= Numerrors) {
        sprintf(obuff, "%s:%s\n", msg, errmsg[errno]);
    }
    else {
        sprintf(obuff, "%s:\n", msg);
        fprintf(stderr, "Unknown error type %d\n", errno);
    }
    fprintf(stderr, "%s", obuff);
    printPageAndFilename();
    printNextTenTokens();
}
```

---

## 5.4 Shared Code for Lexical Analyzer

Lexical analyzer stuff. Exported functions:

- `parserInit()` – initialize the parser tables with keywords
- `initScanner()` – initialize scanner for reading a new page
- `getToken()` – sets the “token” variable to be the next token in the current input stream
- `saveScannerState()` – save the current state of scanner so that the scanner input mode may be switched
- `restoreScannerState()` – undo the saved state

Note: The scanner reads from four separate input locations depending on the value of the variable “inputType”. If this variable is:

- `FromFile` – it read from the file pointed to by “`cfile`”.
- `FromString` – It reads from the string “inputString”.
- `FromSpadSocket` – It reads from the socket pointed to by `spadSocket`
- `FromFD` – It reads from a file descriptor

### 5.4.1 parserInit

Initialize the parser keyword hash table.

— **parserInit** —

```
void parserInit(void) {
    int i;
    Token *toke;
    /* First I initialize the hash table for the tokens */
    hashInit(
        &tokenHashTable,
        TokenHashSize,
        (EqualFunction)stringEqual,
        (HashcodeFunction)stringHash);
    for (i = 2; i <= NumberUserTokens; i++) {
        toke = (Token *) halloc(sizeof(Token), "Token");
        toke->type = i;
        toke->id = token_table[i];
        hashInsert(&tokenHashTable, (char *)toke, toke->id);
    }
}
```

---

### 5.4.2 initScanner

Initialize the lexical scanner to read from a file.

— **initScanner** —

```
void initScanner(void) {
    if (getenv("HTASCII")) {
        useAscii = (strcmp(getenv("HTASCII"), "yes") == 0);
    }
    else {
        if (gTtFontIs850==1) useAscii = 0;
        else useAscii = 1;
    }
    keyword = 0;
    last_ch = NoChar;
    last_token = 0;
    inputType = FromFile;
    fpos = 0;
    keyword_fpos = 0;
    last_command = -1;
    line_number = 1;
}
```

---

### 5.4.3 saveScannerState

These variables save the current state of scanner. Currently only one level of saving is allowed. In the future we should allow nested saves.

— saveScannerState —

```
void saveScannerState(void) {
    StateNode *new_item=(StateNode *)malloc((sizeof(StateNode)), "StateNode");
    new_item->page_start_fpos = page_start_fpos;
    new_item->fpos = fpos;
    new_item->keyword_fpos = keyword_fpos;
    new_item->last_ch = last_ch;
    new_item->last_token = last_token;
    new_item->token = token;
    new_item->inputType = inputType;
    new_item->inputString = inputString;
    new_item->cfile = cfile;
    new_item->next = top_state_node;
    new_item->keyword = keyword;
    top_state_node = new_item;
}
```

---

### 5.4.4 restoreScannerState

Restore the saved scanner state.

— restoreScannerState —

```
void restoreScannerState(void) {
    StateNode *x = top_state_node;
    if (top_state_node == NULL) {
        fprintf(stderr, "Restore Scanner State: State empty\n");
        exit(-1);
    }
    top_state_node = top_state_node->next;
    page_start_fpos = x->page_start_fpos;
    fpos = x->fpos;
    keyword_fpos = x->keyword_fpos;
    last_ch = x->last_ch;
    last_token = x->last_token;
    token = x->token;
    inputType = x->inputType;
    inputString = x->inputString;
    cfile = x->cfile;
    keyword = x->keyword;
    if (cfile != NULL)
        fseek(cfile, fpos + page_start_fpos, 0);
    /** Once that is done, lets throw away some memory **/
    free(x);
}
```

---

```

        case '':
            c = '|';
            break;
        default:
            break;
    }
}
return c;
}

```

---

### 5.4.7 getChar1

Return the next character in the input stream.

— **getChar1** —

```

static int getChar1(void) {
    int c;
    int cmd;
    if (last_ch != NoChar) {
        c = last_ch;
        last_ch = NoChar;
        if (c == '\n')
            line_number++;
        return c;

}

```

#### 5.4.10 pushBeStack

— pushBeStack —

```

void pushBeStack(int type, char * id) {
    BeStruct *be = (BeStruct *) halloc(sizeof(BeStruct), "BeginEND stack");
    if (gWindow != NULL) {
        be->type = type;
        be->next = top_be_stack;
        be->id = allocString(id);
        top_be_stack = be;
    }
    return;
}

```

### 5.4.11 checkAndPopBeStack

This routine pops the be stack and compares types. If they are the same then I am okay and return a 1. Else I return a two and try to print a meaningful message.

— **checkAndPopBeStack** —

```
void checkAndPopBeStack(int type, char * id) {
    BeStruct *x;
    if (gWindow == NULL)
        return;
    if (top_be_stack == NULL) { /* tried to pop when I shouldn't have */
        fprintf(stderr, "Unexpected \\end{%s} \\n", token.id);
        printPageAndFilename();
        printNextTenTokens();
        jump();
    }
    x = top_be_stack;
    if (x->type == type) {
        top_be_stack = top_be_stack->next;
        free(x->id);
        free(x);
        return;
    }
    /* else I didn't have a match. Lets try to write a sensible message */
    fprintf(stderr, "\\begin{%s} ended with \\end{%s} \\n", x->id, id);
    printPageAndFilename();
    printNextTenTokens();
    jump();
}
```

### 5.4.12 clearBeStack

— **clearBeStack** —

```
int clearBeStack(void) {
    BeStruct *x = top_be_stack, *y;
    top_be_stack = NULL;
    while (x != NULL) {
        y = x->next;
        free(x);
        x = y;
    }
    return 1;
}
```

## 5.4.13 beType

— beType —

```

int beType(char *which) {
    Token store;
    getExpectedToken(Lbrace);
    getExpectedToken(Word);
    switch (token.id[0]) {
        case 't':
            if (!strcmp(token.id, "titems")) {
                token.type = Begintitems;
            }
            else {
                return -1;
            }
            break;
        case 'p':
            if (!strcmp(token.id, "page")) {
                token.type = Page;
            }
            else if (!strcmp(token.id, "paste")) {
                token.type = Paste;
            }
            else if (!strcmp(token.id, "patch")) {
                token.type = Patch;
            }
            else {
                return -1;
            }
            break;
        case 'v': /* possibly a verbatim mode */
            if (!strcmp(token.id, "verbatim")) {
                token.type = Verbatim;
            }
            else {
                return -1;
            }
            break;
        case 's': /* possibly a scroll mode */
            if (!strcmp("scroll", token.id)) {
                token.type = Beginscroll;
            }
            else if (!strcmp(token.id, "spadsrc")) {
                token.type = Spadsrc;
            }
            else {
                return -1;
            }
            break;
        case 'i': /* possibly a item */
            if (!strcmp("items", token.id)) {
                token.type = Beginitems;
            }
    }
}

```

```

    }
    else {
        return -1;
    }
    break;
default:
    return -1;
}
store.type = token.type;
/* store.id = allocString(token.id); */
getExpectedToken(Rbrace);
token.type = store.type;

/*
 * strcpy(token.id, store.id); free(store.id);
 */
return 0;
}

```

---

#### 5.4.14 beginType

This routine parses a statement of the form `\begin{word}`. Once it has read the word it tries to assign it a type. Once that is done it sends the word id, and the type to `pushBeStack` and then returns the type. For the moment I cannot even going to use a `hashTable`, although in the future this may be needed.

— **beginType** —

```

int beginType(void) {
    /*Token store;*/
    int ret_val;
    ret_val = beType("begin");
    if (ret_val == -1) {
        if (gWindow == NULL || gInVerbatim)
            return 1;
        else {
            fprintf(stderr, "Unknown begin type \\begin{%s} \n", token.id);
            printPageAndFilename();
            printNextTenTokens();
            jump();
        }
    }
    else {
        if (gWindow != NULL && !gInVerbatim && token.type != Verbatim
            && token.type != Spadsrc) {
            /* Now here I should push the needed info and then get */
            pushBeStack(token.type, token.id);
        }
        return 1;
    }
    return 1;
}

```

---

### 5.4.15 endType

This routine gets the end type just as the beginType routine does, But then it checks to see if recieved the proper endType. By a clever trick, the proper end type is 3000 + type. When environments this will have to change.

— endType —

```
int endType(void) {
    int ret;
    ret = beType("end");
    if (ret == -1) {
        /* unrecognized end token */
        if (gWindow == NULL || gInVerbatim) {
            return 1;
        }
        else {
            fprintf(stderr, "Unknown begin type \\begin{%s} \n", token.id);
            printPageAndFilename();
            printNextTenTokens();
            jump();
        }
    }
    else {
        if (gWindow != NULL && !gInVerbatim) {
            checkAndPopBeStack(token.type, token.id);
            token.type += 3000;
            return 1;
        }
        else {
            if (gWindow != NULL && ((gInVerbatim && token.type == Verbatim) ||
                                   (gInSpadsrc && token.type == Spadsrc))) {
                checkAndPopBeStack(token.type, token.id);
                token.type += 3000;
                return 1;
            }
            else {
                token.type += 3000;
                return 1;
            }
        }
    }
    return 1;
}
```

---

### 5.4.16 keywordType

— keywordType —

```
int keywordType(void) {
    Token *token_ent;
    /* first check to see if it is a reserved token */
    token_ent = (Token *) hashFind(&tokenHashTable, token.id);
    if (token_ent != NULL) {
        token.type = token_ent->type;

        /*
         * if I am a keyword I also have to check to see if I am a begin or
         * an end
         */
        if (token.type == Begin)
            return beginType();
        if (token.type == End)
            return endType();
        /* next check to see if it is a macro */
    }
    else if (gWindow != NULL) {
        if (hashFind(gWindow->fMacroHashTable, token.id) != NULL)
            token.type = Macro;
        else if (gPageBeingParsed->box_hash != NULL &&
            hashFind(gPageBeingParsed->box_hash, token.id) != NULL)
        {
            token.type = Boxcond;
        }
        else if (hashFind(gWindow->fCondHashTable, token.id) != NULL)
            token.type = Cond;
        else
            /* We have no idea what we've got */
            token.type = Unkeyword;
    }
    else {
        /* We am probably in htadd so just return. It
         * is only concerned with pages anyway */
        token.type = Unkeyword;
    }
    return 0;
}
```

— — —

### 5.4.17 getExpectedToken

Read a token, and report a syntax error if it has the wrong type.

— getExpectedToken —

```
void getExpectedToken(int type) {
    getToken();
    if (token.type != type) {
        tokenName(type);
    }
}
```

```

    fprintf(stderr, "syntax error: expected a %s\n", ebuffer);
    if (token.type == EOF) {
        printPageAndFilename();
        fprintf(stderr, "Unexpected EOF\n");
    }
    else {
        tokenName(token.type);
        fprintf(stderr, "not a %s\n", ebuffer);
        printPageAndFilename();
        printNextTenTokens();
    }
    longjmp(jmpbuf, 1);
    fprintf(stderr, "Could not jump to Error Page\n");
    exit(-1);
}
}

```

---

#### 5.4.18 spadErrorHandler

— spadErrorHandler —

```

static void spadErrorHandler(void) {
    /* fprintf(stderr, "got a spad error\n"); */
    longjmp(jmpbuf, 1);
    fprintf(stderr, "(HyperDoc) Fatal Error: Could not jump to Error Page.\n");
    exit(-1);
}

```

---

#### 5.4.19 resetConnection

— resetConnection —

```

void resetConnection(void) {
    if (spadSocket) {
        FD_CLR(spadSocket->socket, &socket_mask);
        purpose_table[spadSocket->purpose] = NULL;
        close(spadSocket->socket);
        spadSocket->socket = 0;
        spadSocket = NULL;
        if (inputString)
            inputString[0] = '\0';
        read_again = 0;
        str_len = 0;
        still_reading = 0;
        connectSpad();
    }
}

```

```
}

```

---

### 5.4.20 spadBusy

Returns true if spad is currently computing.

— spadBusy —

```
int spadBusy(void) {
    if (sessionServer == NULL)
        return 1;
    send_int(sessionServer, QuerySpad);
    return get_int(sessionServer);
}

/* connect to AXIOM , return 0 if succesful, 1 if not */

```

---

### 5.4.21 connectSpad

— connectSpad —

```
int connectSpad(void) {
    if (!MenuServerOpened) {
        fprintf(stderr, "(HyperDoc) Warning: Not connected to AXIOM Server!\n");
        LoudBeepAtTheUser();
        return NotConnected;
    }
    if (spadSocket == NULL) {
        spadSocket = connect_to_local_server(SpadServer, MenuServer, Forever);
        if (spadSocket == NULL) {
            fprintf(stderr,
                "(HyperDoc) Warning: Could not connect to AXIOM Server!\n");
            LoudBeepAtTheUser();
            return NotConnected;
        }
    }
    /* if (spadBusy()) return SpadBusy; */
    return Connected;
}

```

---

## Chapter 6

# Shared include files

### 6.1 debug.c

```
— debug.c —  
\getchunk{include/debug.h}  
  
#ifdef free  
#undef free  
hfree(char *p) {  
    free(p);  
}  
#endif
```

---

### 6.2 include/hyper.h

The `hypertex` function, of which this is the top level, is a browser for Axiom information. It works off a database of pages. The pages are stored in the `$AXIOM/doc` subdirectory and there is a key file called `ht.db` in that subdirectory which contains critical information about each page. If you add or delete pages you must rerun the `htadd` command. (See the `htadd` command in `src/hyper/htadd.pamphlet`.)

Generally, if you add or delete pages you can recreate a proper `pages/ht.db` file by doing:

```
cd $AXIOM/doc  
htadd -f pages -n pages/*
```

The `hypertex` function looks in `$AXIOM/doc` by default. This can be over-ridden by setting the `HTPATH` shell variable to point to the desired directory containing the pages and the `ht.db` file.

```
— include/hyper.h —  
  
/* from bookvol7 chunk include/hyper.h */  
#include <stdio.h>
```

```

#include <stdlib.h>
#include <unistd.h>
#include <limits.h>
#include <X11/Xlib.h>
#include <X11/Xutil.h>
#include <X11/Xos.h>

                           are printing or non-printing */

int (*old_handler) ();
Sock *session_sock, *menu_sock;
char *buff_name = NULL;   /* name for the aixterm */

```

---

## 7.5 Code

This routine used to be used to send sigint onto spad, but now they go through just fine on their own reinstated for AIX V3.2

### 7.5.1 spadbufInterHandler

```

— spadbuf —
static void spadbufInterHandler(int sig) {
    send_signal(session_sock, SIGUSR2);
}

```

---

### 7.5.2 spadbufFunctionChars

```

— spadbuf —
static void spadbufFunctionChars(void) {
    /** once I have that get the special characters      ****/
    _INTR = oldbuf.c_cc[VINTR];
    _QUIT = oldbuf.c_cc[VQUIT];
    _ERASE = oldbuf.c_cc[VERASE];
    _KILL = oldbuf.c_cc[VKILL];
    _EOF = oldbuf.c_cc[VEOF];
    _EOL = oldbuf.c_cc[VEOL];
    return;
}

```

---

### 7.5.3 interpIO

Act as terminal session for sock connected to stdin and stdout of another process.

```

— spadbuf —
static void interpIO(void) {
    char buf[1024];
    fd_set rd;
    int len, command;
    while (1) {
        FD_ZERO(&rd);
        FD_SET(menu_sock->socket, &rd);
        FD_SET(session_sock->socket, &rd);
        FD_SET(1, &rd);
        len = sselect(FD_SETSIZE, &rd, 0, 0, NULL);
        if (len == -1) {
            perror("stdio select");
            return;
        }
        if (FD_ISSET(session_sock->socket, &rd)) {
            len = sread(session_sock, buf, 1024, "stdio");
            if (len == -1)
                return;
            else {

```

```

        write(1, buf, len);
    }
}
if (FD_ISSET(menu_sock->socket, &rd)) {
    command = get_int(menu_sock);
    switch (command) {
        case -1:
            exit(0);
        case ReceiveInputLine:
            get_string_buf(menu_sock, in_buff, 1024);
            num_read = strlen(in_buff);
            clear_buff();
            do_reading();
            break;
        case TestLine:
            break;
        default:
            break;
    }
}
if (FD_ISSET(1, &rd)) {
    num_read = read(0, in_buff, 1024);
    do_reading();
}
}
}

```

—————

#### 7.5.4

— spadbuf —

```

static void initParent(void) {
    /** get the original termio settings, so I never have to check again **/
    if (tcgetattr(0, &oldbuf) == -1) {
        perror("Clef Trying to get terms initial settings");
        exit(-1);
    }
    /** get the settings for my different modes ***/
    if (tcgetattr(0, &canonbuf) == -1) {
        perror("Clef Getting terminal settings");
        exit(-1);
    }
    /** set the buffer to read before an eoln is typed ***/
    canonbuf.c_lflag &= ~(ICANON | ECHO | ISIG);
    canonbuf.c_lflag |= ISIG;

    /** Accordingly tell it we want every character ***/
    canonbuf.c_cc[VMIN] = 1;           /* we want every character */
    canonbuf.c_cc[VTIME] = 1;         /* these may require tweaking */
}

```

```

if (tcsetattr(0, TCSAFLUSH, &canonbuf) == -1) {
    perror("Spadbuf setting parent to canon");
    exit(0);
}
/*
 * This routine is in edin.c and sets the users preferences for function
 * keys. In order to use it I have to set childbuf to be the same as
 * oldbuf
 */
spadbufFunctionChars();
INS_MODE = 0;
ECHOIT = 1;
Cursor_shape(2);
}

```

### 7.5.5 main

Modified on 6/13/90 for the command line completion abilities of Since I am only calling this program from within spadint, I decided that the usage should be.

```
spadbuf page_name [completion_files]
```

— spadbuf —

```

int main(int argc, char ** argv) {
    FILE *fopen();
    if (argc < 2) {
        fprintf(stderr, "Usage : spadbuf page_name [completion_files] \n");
        exit(-1);
    }
    buff_name = *++argv;
    while (*++argv) {
        load_wct_file(*argv);
    }
    skim_wct();
    session_sock=connect_to_local_server(SessionServer, InterpWindow, Forever);
    menu_sock = connect_to_local_server(MenuServerName, InterpWindow, Forever);
    bsdSignal(SIGINT, spadbufInterHandler, RestartSystemCalls);
    /*
     * set contNum so it is pointing down the socket to the childs
     */
    contNum = session_sock->socket;
    send_string(menu_sock, buff_name);
    initParent();
    define_function_keys();
    init_reader();
    PTY = 0;
    interpIO();
    return(1);
}

```

---

        latest_date[1].tv_sec = buf.st_mtime;
    }
}

```

---

### 8.6.5 emitHeader

— ex2ht —

```

void emitHeader(FILE *outFile, char *pageName, char *pageTitle) {
    fprintf(outFile, "\\begin{page}{%s}{%s}\n", pageName, pageTitle);
    fprintf(outFile, "\\begin{scroll}\n\\begin{menu}\n");
}

```

---

### 8.6.6 emitFooter

```

— ex2ht —
void emitFooter(FILE *outFile) {
    fprintf(outFile, "\\endmenu\\endscroll\\end{page}\\n");
}

```

---

### 8.6.7 emitMenuEntry

s is “pageName”{title}”

```

— ex2ht —
void emitMenuEntry(char *line, FILE *outFile) {
    char pageName[MaxLineLength], title[MaxLineLength];
    char *p = pageName, *t = title;
    while (*line != '}')
        *p++ = *line++;
    *p = '\0';
    line++;
    while (*line != '}')
        *t++ = *line++;
    *t = '\0';
    fprintf(outFile, "\\menudownlink%s}{%s}\\n", title, pageName);
}

```

---

### 8.6.8 emitSpadCommand

```

— ex2ht —
void emitSpadCommand(char *line, char *prefix, FILE *outFile) {
    int braceCount = 1;
    char command[MaxLineLength], *t = command;
    while (1) {
        if (*line == '}')
            braceCount--;
        if (braceCount == 0)
            break;
        if (*line == '{')
            braceCount++;
        *t++ = *line++;
    }
    *t = '\0';
    fprintf(outFile, "%s%s\\n", prefix, command);
}

```

### 8.6.9 openCoverPage

---

```

— ex2ht —

void openCoverPage(void) {
    coverFile = fopen("coverex.ht", "w");
    if (coverFile == NULL) {
        fprintf(stderr, "couldn't open coverex.ht for writing\n");
        exit(-1);
    }
    fprintf(coverFile, "% DO NOT EDIT! Created by ex2ht.\n\n");
    fprintf(coverFile, "\\begin{page}{ExampleCoverPage}{Examples Of AXIOM Commands}\n");
    fprintf(coverFile, "\\beginscroll\\table{\n");
}

```

---

### 8.6.10 closeCoverPage

---

```

— ex2ht —

void closeCoverPage(void) {
    fprintf(coverFile, "\\endscroll\\end{page}\n\n");
}

```

---

### 8.6.11 closeCoverFile

---

```

— ex2ht —

void closeCoverFile(void) {
    fclose(coverFile);
    utimes("coverex.ht", latest_date);
}

```

---

### 8.6.12 emitCoverLink

---

```

— ex2ht —

void emitCoverLink(char *name, char *title) {
    fprintf(coverFile, "{\\downlink{%s}{%s}}\n", title, name);
}

```

---

### 8.6.13 addFile

— ex2ht —

```

void addFile(char *filename) {
    FILE *file = fopen(filename, "r");
    int c;

    if (file == NULL) {
        fprintf(stderr, "Couln't open %s for reading\n", filename);
        exit(-1);
    }
    while ((c = getc(file)) != EOF)
        putc(c, coverFile);
    putc('\n', coverFile);
    fclose(file);
    unlink(filename);
}

```

---

### 8.6.14 main

— ex2ht —

```

int main(int argc, char **argv){
    int i;
    if (argc == 1) {
        fprintf(stderr, "usage: %s exfile.ht ...\n", argv[0]);
        return (-1);
    }
    openCoverPage();
    for (i = 1; i < argc; i++)
        exToHt(argv[i]);
    closeCoverPage();
    for (i = 0; i < numFiles; i++)
        addFile(files[i]);
    closeCoverFile();
    return 0;
}

```

---

## Chapter 9

# The htadd command

### 9.1 htadd Call Graph

This was generated by the GNU cflow program with the argument list. Note that the line:NNNN numbers refer to the line in the code after it has been tangled from this file.

```
cflow --emacs -l -n -b -T --omit-arguments htadd.c

;; This file is generated by GNU cflow 1.3. -*- cflow -*-

196 { 2} \-unlink()

```

The `htadd` function can manipulate the database of hypertext pages. To rebuild the hypertext database changes to the `$AXIOM/doc` subdirectory and type:

```
htadd -f pages -n pages/*
```

This will create a file called `pages/ht.db` which contains entries similar to:

```

algebra.ht 1102052108
\page AlgebraPage 216 9
\page NumberTheoryPage 763 28
ALIST.ht 1102052108
\newcommand AssociationListXmpTitle 140 3
\newcommand AssociationListXmpNumber 195 4
\page AssociationListXmpPage 313 7
ALIST.pht 1102052108
\patch AssociationListXmpPagePatch1 0 1
\patch AssociationListXmpPageEmpty1 447 11
...

```

## 9.2 Constants and Headers

### 9.2.1 System includes

— `htadd` —

```

#include <sys/stat.h>
#include <errno.h>
#include <setjmp.h>
#include <ctype.h>

```

---

### 9.2.2 structs

— htadd —

```
typedef struct toke { /* HyperDoc parser tokens */
    int type; /* token type. One of those listed below */
    char *id; /* string value if type == Identifier */
} Token;
```

---

### 9.2.3 Local includes

— htadd —

```
\getchunk{include/hyper.h}
\getchunk{include/htadd.h1}
\getchunk{include/addfile.h1}
\getchunk{include/halloc.h1}
\getchunk{include/hash.h1}
\getchunk{include/hterror.h1}
\getchunk{include/lex.h1}
```

---

### 9.2.4 extern references

— htadd —

```
extern HyperDocPage *gPageBeingParsed;
extern short int gInSpadsrc;
extern short int gInVerbatim;
extern int line_number; /* keeps track of which line a page starts on
                        * in a file. This way someone can start
                        * including a line number counter into
                        * HyperDoc. */
```

---

### 9.2.5 defines

— htadd —

```
#define Delete 1
#define System 2
```

```

#define Current 4
#define Named 8
#define ptype(c, t) (strcpy(c, t));
#define Special(t) (( t == Page || t == NewCommand || t == Patch )?(1):(0))
#define usage "usage: htadd [-s|-l|-f db-directory] [-d|-n] filenames"
#define special(c) ((c) == '{' || (c) == '}' || (c) == '#' || (c) == '%' || \
                    (c) == '\\\' || (c) == '[' || (c) == ']' || (c) == '_' || \
                    (c) == ' ' || (c) == '$' || (c) == '~' || (c) == '^' || \
                    (c) == '&')

#define punctuation(c) ((c) == ',' || (c) == '\'\' || (c) == ',\' || \
                        (c) == '.' || (c) == '?' || (c) == '\"' || \
                        (c) == ';' || (c) == ':' || (c) == '-')

#define whitespace(c) ((c) == ' ' || (c) == '\t' || (c) == '\n')
#define delim(c) \
    (whitespace(c) || special(c) || punctuation(c))
#define filedelim(c) \
    (whitespace(c))

```

---

### 9.2.6 forward declarations

— htadd —

```

static void updateDB(FILE *db, FILE *temp_db, FILE *new_file,
                    char *addname, char *fullname, int fresh);
static void addNewPages(FILE *temp_db, FILE *new_file,
                       char *addname, char *fullname);
static void copyFile(char *f1, char *f2);
static void getFilename(void);
static void deleteDB(FILE *db, FILE *temp_db, char *name);
FILE *htFileOpen(char *fname, char *aname, char *name);
FILE *tempFileOpen(char *temp_dbFile);
char *allocString(char *str);
void printNextTenTokens(void);
int getToken(void);
int keywordType(void);

```

---

### 9.2.7 local variables

— htadd —

```

int fresh = 0;

int MenuServerOpened;

```

```

int gTtFontIs850=0;
HDWindow *gWindow = NULL;
Display *gXDisplay;
int gXScreenNumber;

Sock *sessionServer = NULL;
Sock *spadSocket = NULL;
int still_reading;
int str_len;

```

---

## 9.3 The Shared Code

— htadd —

```
\getchunk{htadd shared code}
```

---

## 9.4 Code

### 9.4.1 parseArgs

This routine parses the command line arguments. It parses the command line arguments. It returns a flag which tells the calling routine what database file to use, and whether or not to delete files.

— htadd —

```

static void parseArgs(char **argv, char *db_dir, char **filenames, short *fl) {
    *fl = 0;
    while (++argv) {
        if (!strcmp(*argv, "-d"))
            *fl |= Delete;
        else if (!strcmp(*argv, "-s")) {
            if (*fl & Current || *fl & Named) {
                fprintf(stderr, "%s\n", usage);
                exit(-1);
            }
            *fl |= System;
        }
        else if (!strcmp(*argv, "-n")) {
            fresh = 1;
        }
        else if (!strcmp(*argv, "-l")) {
            if (*fl & System || *fl & Named) {
                fprintf(stderr, "%s\n", usage);
                exit(-1);
            }
        }
    }
}

```

```

        *fl |= Current;
    }
    else if (!strcmp(*argv, "-f")) {
        if (*fl & System || *fl & Current) {
            fprintf(stderr, "%s\n", usage);
            exit(-1);
        }
        *fl |= Named;
        strcpy(db_dir, *++argv);
    }
    else
        *filenames++ = *argv;
}
*filenames = NULL;
}

```

---

### 9.4.2 writable

Check to see if the user has permission

— **htadd** —

```

static int writable(struct stat buff) {
#ifdef DEBUG
    unsigned short uid = geteuid(), gid = getegid();
    fprintf(stderr, "Uid = %d and Gid = %d\n", uid, gid);
#endif
    /*
     * Checks the status structure sent against the user id, and group id
     */
    if ((buff.st_uid == geteuid()) && (buff.st_mode & S_IWUSR))
        return 1;
    else if ((buff.st_gid == getegid()) && (buff.st_mode & S_IWGRP))
        return 1;
    else if ((buff.st_mode & S_IWOTH))
        return 1;
    return 0;
}

```

---

### 9.4.3 buildDBFilename

This procedure builds the db filename. Subsequently, it is passed onto all the add files that are called.

— **htadd** —

```

static int buildDBFilename(short flag, char *db_dir, char *dbfilename) {
    int ret_status;
    struct stat buff;
    char *SPAD;

```

```

char path[256];
if (flag & System) {
    SPAD = (char *) getenv("AXIOM");
    if (SPAD == NULL) {
        fprintf(stderr,
            "buildDBFilename: Defaulting on $AXIOM\n");
        SPAD = (char *) def_spad;
    }
    sprintf(dbfilename, "%s/doc/%s", SPAD, dbFileName);
    sprintf(path, "%s/doc", SPAD);
}
else if (flag & Named) {
    sprintf(dbfilename, "%s/%s", db_dir, dbFileName);
    strcpy(path, db_dir);
}
else {
    /* use the current directory */
    sprintf(dbfilename, "./%s", dbFileName);
    sprintf(path, ".");
}
/* fprintf(stderr, "htadd:buildDBFilename:dbfilename=%s\n", dbfilename); */
/* Now see if I can write to the file */
ret_status = stat(dbfilename, &buff);
if (ret_status == -1) {
    if (errno == ENOENT) {
        /* If the file does not exist, then check it's path */
        ret_status = stat(path, &buff);
    }
    if (ret_status == -1) {
        perror("build_dbFile");
        exit(-1);
    }
}
/* check the status */
if (writable(buff))
    return 1;
fprintf(stderr, "buildDBFilename: Database file name is not writable\n");
exit(-1);
return 0;
}

```

#### 9.4.4 addfile

This procedure now works as follows:

1. It adds the files to the dbFile without full pathnames.  
Two names are going to be used when adding a file -
  - addname j- The name without any paths
  - fullname j- The name with a path prepended to it
2. If the user specifies a pathname, then it is the path name that is used. If the user does

not specify a path name, then possible paths are found as follows:

- If the user has an environment variable HTPATH set, the paths mentioned are used.
- If not, then the \$AXIOM environment variable is used.

— htadd —

```
static void addfile(char *dbname, char *name, int fresh) {
    char fullname[256];
    char temp_dbFile[256];
    FILE *db_fp = NULL;
    FILE *temp_db_fp = NULL;
    FILE *ht_fp = NULL;
    char addname[100];
    /*char *HTPATH;*/
    /*char *trace;*/
    /*char *spad;*/

## Chapter 10

# The hthits function

This source file implements HyperDoc's ability to scan files for a given pattern. For that purpose it needs a "regex" for string pattern matching.

This source file used to rely on `<regex.h>` which was originally part of the X/Open System Interface and Headers Issue 2. However, since then, it has been withdrawn and no longer always available on newer platforms. Consequently, we need to use a different, portable regex library. The POSIX definition provides one, namely through `<regex.h>`. That is what we use now. Its availability is tested at configure time.

```
hthits pattern htldb-file
```

Scan HyperDoc files for a given pattern.

The output contains lines of the form:

```
page-name'title'n
```

The title and body of each page are scanned but the name is not. It is possible that the title matches but not any lines. The number of matches in the page (n) is given last. (SMW Feb 91)

### 10.1 hthits Call Graph

This was generated by the GNU cflow program with the argument list. Note that the line:NNNN numbers refer to the line in the code after it has been tangled from this file.

```
cflow --emacs -l -n -b -T --omit-arguments hthits.c

    }
    if (nhits) {
        printf("\\newsearchresultentry{%d}{%s}", nhits, pgtitle);
    }
}

```

```

        squirt(pgname, strlen(pgname));
        printf("\n");
    }
}

```

---

### 10.2.12 squirt

Given string *s* and length *n*, output ‘ followed by the first *n* characters of *s* with ‘ and newline converted to blanks. This function destructively modifies *s*.

— hthits —

```

void squirt(char *s, int n) {
    register char *t, *e;
    int c;
    c = s[n];
    for (t = s, e = s + n; t < e; t++)
        if (*t == ' ' || *t == '\n')
            *t = ' ';
    if (s[n] != 0) {
        s[n] = 0;
    }
    printf("{%.s}", n, s);
    s[n] = c;
}

```

---

### 10.2.13 splitpage

Any newlines and separator characters in the title are changed to blanks.

— hthits —

```

void splitpage(char *buf, char **ptitle, char **pbody) {
    int n, depth, tno;
    char *s;
    switch (buf[1]) {
        case 'p':
            tno = 2;
            break;
            /* \page{Name}{Title} */
        case 'b':
            tno = 3;
            break;
            /* \begin{page}{Name}{Title} */
        default:
            fprintf(stderr, "%s: Invalid page format: %s\n", progName, buf);
            exit(1);
    }
    n = 0;
    depth = 0;
    for (s = buf; *s; s++) {
        if (*s == '{')

```

```

        if (++depth == 1 && ++n == tno)
            *ptitle = s + 1;
    if (*s == '}')
        if (depth-- == 1 && n == tno) {
            *s = 0;
            *pbody = s + 1;
            break;
        }
    }
}

```

---

### 10.2.14 `untexbuf`

— `hthits` —

```

void untexbuf(register char *s) {
    register char *d = s;
    while (*s)
        switch (*s) {
            case '\\':
                *d++ = ' ';
                s++;
                if (*s != '%')
                    while (isalpha(*s))
                        s++;
                break;
            case '%':
                *d++ = ' ';
                s++;
                while (*s && *s != '\\n')
                    s++;
                break;
            case '{':
            case '}':
            case '#':
                *d++ = ' ';
                s++;
                break;
            default:
                *d++ = *s++;
        }
    *d = 0;
}

```

---

### 10.2.15 badDB

```
— hthits —  
void badDB(void) {  
    fprintf(stderr, "%s: bad database file %s\n", progName, htbfName);  
    exit(1);  
}
```

---

### 10.2.16 regerr

```
— hthits —  
void regerr(int code) {  
    fprintf(stderr, "%s: regular expression error %d for \"%s\"\n",  
            progName, code, pattern);  
}
```

---

### 10.2.17 main

```
— hthits —  
int main(int argc, char ** argv) {  
    cmdline(argc, argv);  
    regcomp(&reg_pattern, pattern, REG_NEWLINE);  
    handleHtdb();  
    return(0);  
}
```

---

## Chapter 11

# The hypertext command

This is the main module of the HyperDoc program. It contains the main routine which initializes all the X stuff, and the tables. Then it passes control over to the main event loop.

### 11.1 Constants and Headers

#### 11.1.1 System includes

— hypertext —

```
#ifndef SGIplatform
#include <bstring.h>
#endif
#include <ctype.h>
#include <fcntl.h>
#include <setjmp.h>
#include <signal.h>
#include <stdlib.h>
#include <sys/errno.h>
#include <sys/signal.h>
#include <sys/stat.h>
#include <sys/time.h>
#include <sys/types.h>
#include <sys/wait.h>
#include <unistd.h>
#include <X11/cursorfont.h>
#include <X11/keysym.h>
#include <X11/X.h>
#include <X11/Xatom.h>
#include <X11/Xresource.h>
```

—

## 11.2 structs

— hypertex —

```
typedef struct token { /* HyperDoc parser tokens */
    int type;          /* token type. One of those listed below */
    char *id;          /* string value if type == Identifier */
} Token;
```

---

### 11.2.1 Local includes

— hypertex —

```
\getchunk{include/debug.h}
\getchunk{include/hyper.h}

\getchunk{include/all-hyper-proto.h1}
\getchunk{include/bsdsignal.h}
\getchunk{include/bsdsignal.h1}
\getchunk{include/hterror.h1}
\getchunk{include/pixmap.h1}
\getchunk{include/sockio-c.h1}
\getchunk{include/spadcolors.h}
\getchunk{include/spadcolors.h1}
\getchunk{include/util.h1}
```

---

## 11.3 structs

— hypertex —

```
typedef struct mr_stack {
    /** The structure for storing parser mode and region **/
    short int fParserMode;
    short int fParserRegion;
    struct mr_stack *fNext;
} MR_Stack;

typedef struct sock_list { /* linked list of Sock */
    Sock Socket;
    struct sock_list *next;
} Sock_List;
```

---

## 11.8 Code

### 11.8.1 sigusr2Handler

SIGUSR2 is raised by the spadbuf program when it is done with the current command

— **hypertex** —

```

void sigusr2Handler(int sig) {
    gIsEndOfOutput = 1;
    return ;
}

```

---

### 11.8.2 sigcldHandler

Why were we waiting after the child had already died? Because we don't want zombies

— **hypertex** —

```

void sigcldHandler(int sig) {
    int x;
    wait(&x);
}

```

---

### 11.8.3 cleanSocket

Clean up spad sockets on exit.

— **hypertex** —

```
void cleanSocket(void) {
    char name[256];
    make_server_name(name, MenuServerName);
    unlink(name);
}
```

---

### 11.8.4 initHash

Initializes the hash table for Files, and Windows

— **hypertex** —

```
static void initHash(void) {
    hashInit(&gFileHashTable,
            FileHashSize,
            (EqualFunction)stringEqual,
            (HashcodeFunction) stringHash);
    hashInit(&gSessionHashTable,
            SessionHashSize,
            (EqualFunction) windowEqual,
            (HashcodeFunction) windowCode);
    hashInit(&gImageHashTable,
            ImageHashSize,
            (EqualFunction) stringEqual,
            (HashcodeFunction) stringHash);
}
```

---

### 11.8.5 initPageStructs

Initialize the HyperDoc page hierarchy data structures

— **hypertex** —

```
void initPageStructs(HDWindow *w) {
    int i;
    w->fMemoStackIndex = 0;
    for (i = 0; i < MaxMemoDepth; i++) {
        w->fMemoStack[i] = NULL;
        w->fDownLinkStackTop[i] = 0;
    }
    w->fDownLinkStackIndex = 0;
    for (i = 0; i < MaxDownlinkDepth; i++)
        w->fDownLinkStack[i] = NULL;
}
```

### 11.8.6 checkArguments

— hypertex —

```
static void checkArguments(void) {
    int i;
    /*
     * Now check the command line arguments, to see if I am supposed to be a
     * server or not
     */
    for (i = 1; i < gArgc; i++) {
        if (gArgv[i][0] == '-')
            switch (gArgv[i][1]) {
                case 'p':
                    gverify_dates=1;
                    break;
                case 's':
                    if (!MenuServerOpened) {
                        fprintf(stderr, "(HyperDoc) Server already in use.\n");
                        exit(-1);
                    }
                    gIsAxiomServer = 1;
                    break;
                case 'i':
                    if (gArgv[i][2] == 'p')

## 11.9 Condition Handling

### 11.9.1 insertCond

This routine creates a new cond node and inserts it into the current cond table

— hypertex —

```
void insertCond(char *label, char *cond) {
    CondNode *condnode = (CondNode *) hashFind(gWindow->fCondHashTable, label);
    if (condnode) {
        fprintf(stderr, "Error: \\%s is declared twice \\n", label);
        printPageAndFilename();
    }
}
```

```

    jump();
}
condnode = allocCondnode();
condnode->label = malloc(strlen(label) + 1, "Condnode->label");
condnode->cond = malloc(strlen(cond) + 1, "Condnode->cond");
strcpy(condnode->label, label);
strcpy(condnode->cond, cond);
hashInsert(gWindow->fCondHashTable, (char *) condnode, condnode->label);
}

```

---

### 11.9.2 changeCond

— hypertext —

```

void changeCond(char *label, char *newcond) {
    CondNode *condnode = (CondNode *) hashFind(gWindow->fCondHashTable, label);
    if (condnode == NULL) {
        fprintf(stderr, "Error: Tried to set an uncreated cond %s\n", label);
    }
    else {
        free(condnode->cond);
        condnode->cond = malloc(strlen(newcond) + 1, "Condnode->cond");
        strcpy(condnode->cond, newcond);
    }
}

```

---

### 11.9.3 checkMemostack

— hypertext —

```

static int checkMemostack(TextNode *node) {
    char *buffer;
    int stackp = gWindow->fMemoStackIndex;
    int found = 0;
    HyperDocPage *page;
    buffer = printToString(node->data.node);
    /*
     * Once we have done that much, search down the stack for the
     * proper page
     */
    while (!found && stackp > 0) {
        page = gWindow->fMemoStack[--stackp];
        if (!strcmp(page->name, buffer))
            found = 1;
    }
    return found;
}

```

---

}

#### 11.9.4 checkCondition

Checks the condition presented and returns a 1 or a 0.

— **hypertex** —

```
int checkCondition(TextNode *node) {
    CondNode *cond;
    InputBox *box;
    int ret_val;
    switch (node->type) {
        case Cond:
            cond = (CondNode *) hashFind(gWindow->fCondHashTable, node->data.text);
            if (!strcmp("0", cond->cond))
                return 0;
            else
                return 1;
        case Boxcond:
            box = (InputBox *) hashFind(gWindow->page->box_hash, node->data.text);
            return (box->picked);
        case Haslisp:
            if (spadSocket != NULL) {
                ret_val = send_int(spadSocket, TestLine);
                return (ret_val + 1);
            }
            else
                return 0;
        case Hasup:
            return need_up_button;
        case Hasreturn:
            return gWindow->fMemoStackIndex;
        case Hasreturnto:
            return (checkMemostack(node));
        case Lastwindow:
            return(gSessionHashTable.num_entries == 1 || gParentWindow == gWindow);
        default:
            return 0;
    }
}
```

---

## 11.10 Dialog Handling

### 11.10.1 redrawWin

— hypertext —

```
static void redrawWin(void) {
    XUnmapSubwindows(gXDisplay, gWindow->fMainWindow);
    XUnmapSubwindows(gXDisplay, gWindow->fScrollWindow);
    XFlush(gXDisplay);
    showPage(gWindow->page);
}
```

---

### 11.10.2 mystrncpy

Copies the characters from buff1 to buff2 starting at position buff2+n and buff1+n

— hypertext —

```
static char *mystrncpy(char *buff1, char *buff2, int n) {
    int i;
    for (i = n - 1; i >= 0; i--)
        *(buff1 + i) = *(buff2 + i);
    return buff2;
}
```

---

### 11.10.3 incLineNumbers

— hypertext —

```
static void incLineNumbers(LineStruct *line) {
    for (; line != NULL; line = line->next)
        line->line_number++;
}
```

---

### 11.10.4 decLineNumbers

— hypertext —

```
static void decLineNumbers(LineStruct *line) {
    for (; line != NULL; line = line->next)
        line->line_number--;
    return;
}
```

```
}

```

---

### 11.10.5 decreaseLineNumbers

— hypertext —

```
static void decreaseLineNumbers(LineStruct *line, int am) {
    for (; line != NULL; line = line->next)
        line->line_number -= am;
}
```

---

### 11.10.6 overwriteBuffer

— hypertext —

```
static void overwriteBuffer(char *buffer, InputItem *item) {
    LineStruct *newline;
    LineStruct *addline = item->curr_line;
    /*int bufflen = strlen(buffer);*/
    int nl = 0;
    int cursor_y;
    int size = item->size;
    /* add a single character */
    cursor_y = (addline->line_number - 1) * line_height;
    if (addline->buff_pntr == size) {
        clearCursor(item);
        if (addline->len <= size) {
            nl = 1;
            addline->buffer[size] = '_';
            addline->buffer[size + 1] = 0;
            addline->len = size + 1;
            newline = (LineStruct *) allocInputline(size + 2);
            newline->line_number = addline->line_number + 1;
            incLineNumbers(addline->next);
            newline->next = addline->next;
            newline->prev = addline;
            if (addline->next)
                addline->next->prev = newline;
            addline->next = newline;
            item->num_lines++;
            cursor_y += line_height;
            item->curr_line = addline = newline;
        }
        else {
            item->curr_line = addline = addline->next;
        }
    }
}
```

```

        addline->len = 1;
        addline->buff_ptr = 1;
        addline->buffer[0] = buffer[0];
    }
    else {
        addline->buffer[addline->buff_ptr] = buffer[0];
        clearCursor(item);
        if (++addline->buff_ptr > addline->len)
            addline->len++;
    }
    /* now set up the current line */
    if (item->curr_line->buff_ptr >= item->size &&
        item->curr_line->next != NULL && !item->curr_line->next->len) {
        /* I should actually be on the next line */
        item->curr_line->buffer[item->size] = '_';
        item->curr_line->len = item->size + 1;
        XDrawString(gXDisplay, item->win, gWindow->fInputGC, start_x,
                    cursor_y + start_y,
                    addline->buffer,
                    addline->len);
        item->curr_line = item->curr_line->next;
        item->curr_line->buff_ptr = 0;
        item->curr_line->changed = 1;
    }
    if (!nl) {
        XDrawString(gXDisplay, item->win, gWindow->fInputGC, start_x,
                    cursor_y + start_y,

                    addline->len);
        drawCursor(item);
    }
    else
        redrawWin();
}

/*
*/

```

### 11.10.7 moveSymForward

This routine takes the current line and moves it num forward. The only way I have to move any other lines forward is if this line has length  $\geq$  size

— **hypertex** —

```

static int moveSymForward(LineStruct *line, int num, int size,
                          InputItem *sym) {
    LineStruct *newline;
    int diff;
    int nl = 0;
    if (line->len > size) {
        nl = moveSymForward(line->next, num, size, sym);
    }
}

```

```

    strncpy(line->next->buffer,
            &line->buffer[sym->size - num], line->len);
    strncpy(&line->buffer[num],
            line->buffer, num);
    line->changed = 1;
    return nl;
}
else {
    if (line->len + num > size) {
        diff = line->len + num - size;
        newline = allocInputline(size);
        newline->len = diff;
        newline->line_number = line->line_number++;
        incLineNumbers(line->next);
        sym->num_lines++;
        newline->next = line->next;
        newline->prev = line;
        if (line->next)
            line->next->prev = newline;
        line->next = newline;
        strncpy(newline->buffer, &line->buffer[size - diff], diff);
        strncpy(&line->buffer[num], line->buffer, num);
        line->buffer[size] = '_';
        line->buffer[size + 1] = 0;
        line->len = size + 1;
        return 1;
    }
    else {
        strncpy(&line->buffer[num], line->buffer, line->len);
        line->len += num;
        line->changed = 1;
        return 0;
    }
}
}

```

---

### 11.10.8 clearCursorline

— hypertext —

```

static void clearCursorline(InputItem *sym) {
    XCharStruct extents;
    int dir, asc, des;
    int cursor_y;
    XTextExtents(gInputFont, sym->curr_line->buffer,
                sym->curr_line->buff_pntr,
                &dir, &asc, &des, &extents);
    cursor_y = (sym->curr_line->line_number - 1) * line_height;
    sym->cursor_x = start_x + extents.width;
    XClearArea(gXDisplay, sym->win, sym->cursor_x, cursor_y,

```

```

        gWindow->width, line_height, False);
XDrawString(gXDisplay, sym->win, gWindow->fInputGC, start_x,
            cursor_y + start_y, sym->curr_line->buffer,
            sym->curr_line->len);
}

```

### 11.10.9 insertBuffer

— hypertext —

```

static void insertBuffer(char *buffer, InputItem *sym) {
    /*int num = strlen(buffer);*/
    LineStruct *line = sym->curr_line;
    LineStruct *newline;

### 11.10.28 deleteChar

— hypertext —

```

static void deleteChar(InputItem *sym) {
    if (deleteOneChar(sym))
        updateInputsymbol(sym);
}

```

---

### 11.10.29 toughEnter

This routine takes all the characters from the current cursor on, and copies them into a temp buffer, from which they are recopied back starting at the next line.

— **hypertex** —

```
static void toughEnter(InputItem *sym) {
    char buff[1024];
    LineStruct *trace;
    LineStruct *last = 0;
    LineStruct *newline;
    char *tr = buff;
    int bp = sym->curr_line->buff_pntr;
    int size = sym->size;
    /* Copy the stuff from the current line */
    for (; bp < size; bp++)
        *tr++ = sym->curr_line->buffer[bp];
    /* now get the stuff from the rest of the lines */
    for (trace = sym->curr_line->next;
         trace->len > sym->size; trace = trace->next)
        for (bp = 0; bp < size; bp++)
            *tr++ = trace->buffer[bp];
    /* copy the last line */
    for (bp = 0; bp < trace->len; bp++)
        *tr++ = trace->buffer[bp];
    *tr = 0;
    /* Now that I have the buffer, let's put it back where it belongs. */
    last = trace;
    trace = sym->curr_line;
    trace->len = trace->buff_pntr;
    trace->buffer[trace->len] = 0;
    trace->changed = 1;
    tr = buff;
    for (trace = trace->next; trace != last; trace = trace->next) {
        for (bp = 0; bp < size; bp++)
            trace->buffer[bp] = *tr++;
        trace->len = size + 1;
        trace->buffer[size + 1] = 0;
        trace->buffer[size] = '_';
        trace->changed = 1;
    }
    /* Once I am here, I should be able to copy this last line */
    for (bp = 0; bp < size && *tr; bp++)
        trace->buffer[bp] = *tr++;
    trace->changed = 1;
    /* If I still have more to copy, then do so onto a new line */
    if (*tr) {
        trace->len = size + 1;
        trace->buffer[size + 1] = 0;
        trace->buffer[size] = '_';

## 11.11 Format and Display a page

Display is performed in two steps. First the page is formatted assuming that we have an infinitely long window. In this stage we compute and store the coordinates of every text node. Next the page is actually drawn on the screen. In this process we use the value of `page->y_off` as an offset into the scrolling region to compute what is actually to be displayed on the page.

### 11.11.1 showPage

— hypertext —

```

void showPage(HyperDocPage *page) {
    XWindowChanges wc;
    int doShowScrollBars = 1;
    initTopGroup();
    /* Clear the areas so we can rewrite the page */
    XClearWindow(gXDisplay, gWindow->fMainWindow);
    XClearWindow(gXDisplay, gWindow->fScrollWindow);
    /* Free the active button list */
    freeButtonList(page->s_button_list);
    page->s_button_list = NULL;
    freeButtonList(page->button_list);
    page->button_list = NULL;
    /* The compute the text extents */
    computeTitleExtent(page);
    computeHeaderExtent(page);
    computeFooterExtent(page);
    computeScrollingExtent(page);
    /*
     * Now that we have all the extents computed, reconfigure and map the
     * scroll window
     */
    if (page->scrolling) {
        int width, height;
    }
}

```

```

calculateScrollBarMeasures();
wc.x = 0;
wc.y = page->top_scroll_margin + scroll_top_margin;
wc.height = gWindow->scrollheight;
if (gWindow->page->scrolling->height <= gWindow->scrollheight) {
    gWindow->page->scroll_off = 0;
    wc.width = gWindow->width;
}
else
    wc.width = gWindow->width - gScrollbarWidth;
getScrollBarMinimumSize(&width, &height);
if (height > wc.height) {
    wc.height = gWindow->scrollheight = 1;
    doShowScrollBars = 0;
}
else
    gWindow->scrollwidth = wc.width;
if (doShowScrollBars) {
    XConfigureWindow(gXDisplay, gWindow->fScrollWindow,
                     CWX | CWY | CWHeight | CWWidth, &wc);
    XMapWindow(gXDisplay, gWindow->fScrollWindow);
}
else {
    XUnmapWindow(gXDisplay, gWindow->fScrollWindow);
    hideScrollBars(gWindow);
}
}
/* clear the group stack */
while (popGroupStack() >= 0)
    ;
/* Now start displaying all the text */
gWindow->fDisplayedWindow = gWindow->fMainWindow;
gRegionOffset = 0;
yOff = 0;
gDisplayRegion = Header;

}

```

---

## 11.12 Event Handling

This is the main X loop. It keeps grabbing events. Since the only way the window can die is through an event, it never actually end. One of the subroutines it calls is responsible for killing everything.

### 11.12.1 mainEventLoop

— hypertext —

```

void mainEventLoop(void) {
    XEvent event;
    int Xcon;
    fd_set rd, dum1, dum2;
    motion = 0;
    gActiveWindow = -1;
    setErrorHandlers();

```

```

Xcon = ConnectionNumber(gXDisplay);
while (1) {
    /*fprintf(stderr,"event:mainEventLoop: loop top\n");*/
    while (gSessionHashTable.num_entries == 0)
        pause();
    /* XFlush(gXDisplay);      */
    if (!motion)
        initCursorStates();
    motion = 0;
    if (!spadSocket == 0) {
        FD_ZERO(&rd);
        FD_ZERO(&dum1);
        FD_ZERO(&dum2);
        FD_CLR(0, &dum1);
        FD_CLR(0, &dum2);
        FD_CLR(0, &rd);
        FD_SET(spadSocket->socket, &rd);
        FD_SET(Xcon, &rd);
        if (!sessionServer == 0) {
            FD_SET(sessionServer->socket, &rd);
        }
        if (XEventsQueued(gXDisplay, QueuedAlready)) {
            XNextEvent(gXDisplay, &event);

    gWindow->fWindowHashTable = gWindow->page->fLinkHashTable;
    /* then select for the events I normally would like to catch */
    XSelectInput(gXDisplay, gWindow->fMainWindow, ButtonPress | KeyPressMask |
        PointerMotionMask |
        ExposureMask /* | EnterWindowMask | LeaveWindowMask */ );
    XSelectInput(gXDisplay, gWindow->fScrollWindow, ExposureMask);
}

/*
*/

```

---

### 11.12.4 quitHyperDoc

This routine is called when the quitbutton is hit. For the moment I am just going to leave it all behind.

— hypertext —

```

void quitHyperDoc(void) {
    HyperDocPage *page;
    if (gSessionHashTable.num_entries == 1 || gParentWindow == gWindow) {
        if (!strcmp(gWindow->page->name, "ProtectedQuitPage")){
            exitHyperDoc();
        }
        page =
            (HyperDocPage *)hashFind(gWindow->fPageHashTable, "ProtectedQuitPage");
        if (page == NULL) {
            fprintf(stderr, "Unknown page name %s\n", "ProtectedQuitPage");
            exitHyperDoc();
            return;
        }
        if (gWindow->fDownLinkStackIndex == MaxDownlinkDepth)
            fprintf(stderr, "exceeded maximum link nesting level\n");
        else
            gWindow->fDownLinkStack[gWindow->fDownLinkStackIndex++] =
                gWindow->page;

        gWindow->page = page;
        displayPage(gWindow->page);
        gWindow->fWindowHashTable = gWindow->page->fLinkHashTable;
    }
    else
        exitHyperDoc();
}

```

### 11.12.5 findPage

findPage takes as an argument the HyperDoc for a page name and returns the associated page.

— hypertext —

```

static HyperDocPage *findPage(TextNode * node) {
    char *page_name;
    HyperDocPage *page;
    /* try and find the page name */
    page_name = printToString(node);
    page = (HyperDocPage *) hashFind(gWindow->fPageHashTable, page_name);
    if (page == NULL) {
        /* try to find the unknown page */
        page=(HyperDocPage *) hashFind(gWindow->fPageHashTable, "UnknownPage");
        if (page == NULL) {
            /* Yikes, Even that could not be found */
            fprintf(stderr, "Unknown page name %s\n", page_name);
        }
        else {
            if (page->type == UnloadedPageType)
                page->type = UlUnknownPage;
            else
                page->type = UnknownPage;
        }
    }
}

```

```

    }
    return page;
}

```

---

### 11.12.6 downlink

Pushes a page onto the down link stack.

— **hypertex** —

```

static void downlink(void) {
    if (gWindow->fDownLinkStackIndex == MaxDownlinkDepth)
        fprintf(stderr, "exceeded maximum link nesting level\n");
    else
        gWindow->fDownLinkStack[gWindow->fDownLinkStackIndex++] = gWindow->page;
}

```

---

### 11.12.7 memolink

— **hypertex** —

```

static void memolink(void) {
    if (gWindow->fMemoStackIndex == MaxMemoDepth)
        fprintf(stderr, "exceeded maximum link nesting level\n");
    else {
        gWindow->fMemoStack[gWindow->fMemoStackIndex] = gWindow->page;
        gWindow->fDownLinkStackTop[gWindow->fMemoStackIndex++] =
            gWindow->fDownLinkStackIndex;
    }
}

```

---

### 11.12.8 killAxiomPage

— **hypertex** —

```

static void killAxiomPage(HyperDocPage * page) {
    char command[512];
    sprintf(command, "(|httpDestroyPage| '%s)", page->name);
    sendLispCommand(command);
}

```

---

### 11.12.9 killPage

— hypertext —

```
static void killPage(HyperDocPage * page) {
    page->scroll_off = 0;
    if (page->type == SpadGen) {
        hashDelete(gWindow->fPageHashTable, page->name);
        killAxiomPage(page);
        freePage(page);
    }
}
```

---

### 11.12.10 returnlink

Pops the memo stack.

— hypertext —

```
static HyperDocPage *returnlink(void) {
    int i;
    if (gWindow->fMemoStackIndex == 0) {
        BeepAtTheUser();
        return NULL;
    }
    else {
        killPage(gWindow->page);
        for (i = gWindow->fDownLinkStackIndex - 1;
             i >= gWindow->fDownLinkStackTop[gWindow->fMemoStackIndex - 1];
             i--)
        {
            killPage(gWindow->fDownLinkStack[i]);
        }
        gWindow->fDownLinkStackIndex =
            gWindow->fDownLinkStackTop[--gWindow->fMemoStackIndex];
        return (gWindow->fMemoStack[gWindow->fMemoStackIndex]);
    }
}
```

/\* pops a page if it can from the downlink stack \*/

---

### 11.12.11 uplink

— hypertext —

```
static HyperDocPage *uplink(void) {
    if (gWindow->fDownLinkStackIndex == 0)
        return returnlink();
}
```

```

    else {
        killPage(gWindow->page);
        return (gWindow->fDownLinkStack[--gWindow->fDownLinkStackIndex]);
    }
}

```

---

### 11.12.12 windowlinkHandler

— hypertext —

```

static void windowlinkHandler(TextNode * node) {
    char *page_name;
    /* first try and find the page */
    page_name = printToString(node);
    if (initTopWindow(page_name) == -1) {
        return;
    }
    /* gWindow->fWindowHashTable = gWindow->page->fLinkHashTable; */
}

```

---

### 11.12.13 makeWindowLink

— hypertext —

```

void makeWindowLink(char *name) {
    if (initTopWindow(name) != -1)
    {}/* gWindow->fWindowHashTable = gWindow->page->fLinkHashTable; */
}

```

---

### 11.12.14 lispwindowlinkHandler

Since we are popping up a new window, then we had better change all the cursors right away. We won't get another chance at it.

— hypertext —

```

static void lispwindowlinkHandler(HyperLink * link) {
    if (initTopWindow(NULL) != -1) {
        HyperDocPage *page = NULL;
        int frame = gWindow->fAxiomFrame;

        page = issueServerCommand(link);
        gWindow->fAxiomFrame = frame;
    }
}

```

```

        gWindow->page = page;
/*      gWindow->fWindowHashTable = gWindow->page->fLinkHashTable;*/
    }
}

```

---

### 11.12.15 pasteButton

— hypertext —

```

static HyperDocPage *pasteButton(PasteNode * paste) {
    HyperDocPage *page = NULL;
    int pastewhere=paste->where;
    if ( paste->end_node ==NULL ||
        paste->begin_node==NULL ||
        paste->arg_node==NULL ) {
        BeepAtTheUser();
        return NULL;
    }
    page=parsePatch(paste);
/* paste has changed after this call so use pastewhere*/
    if (pastewhere && page ) {
        if (0 == strcmp(page->name, "ErrorPage"))
            page = NULL;
    }
    else
        BeepAtTheUser();
    return page;
}

```

---

### 11.12.16 helpForHyperDoc

— hypertext —

```

void helpForHyperDoc(void) {
    HyperDocPage *page = NULL;
    /* do not do anything if we are already at the "no more help" page */
    if (0 == strcmp(gWindow->page->name, NoMoreHelpPage))
        return;
    /* if no help page recorded, use the standard "no more help" page */
    if (!gWindow->page->helppage)
        gWindow->page->helppage = allocString(NoMoreHelpPage);
    /* if we are on the main help page, use "no more help" page */
    if (0 == strcmp(gWindow->page->name, TopLevelHelpPage))
        gWindow->page->helppage = allocString(NoMoreHelpPage);
    page =
        (HyperDocPage *)hashFind(gWindow->fPageHashTable,gWindow->page->helppage);
}

```

```

    if (page)
        makeWindowLink(gWindow->page->helppage);
    else
        BeepAtTheUser();
}

```

---

### 11.12.17 findButtonInList

— hypertext —

```

static HyperLink *findButtonInList(HDWindow * window, int x, int y) {
    ButtonList *bl;
    if (!window || window->page->type == UnloadedPageType)
        return NULL;
    for (bl = window->page->s_button_list; bl != NULL; bl = bl->next)
        if (x >= bl->x0 && x <= bl->x1 && y >= bl->y0 && y <= bl->y1)
            return bl->link;
    for (bl = window->page->button_list; bl != NULL; bl = bl->next)
        if (x >= bl->x0 && x <= bl->x1 && y >= bl->y0 && y <= bl->y1)
            return bl->link;
    return NULL;
}

```

---

### 11.12.18 getHyperLink

— hypertext —

```

static HyperLink *getHyperLink(XButtonEvent * event) {
    HyperLink *l1, *l2;
    l1 =
        (HyperLink *)hashFind(gWindow->fWindowHashTable, (char *)&(event->>window));
    if (l1)
        return l1;
    l2 = findButtonInList(gWindow, event->x, event->y);
    return l2;
}

```

---

### 11.12.19 handleButton

Handle a button pressed event. window is the subwindow in which the event occurred, and button is the button which was pressed.

— hypertext —

```

static void handleButton(int button, XButtonEvent * event) {
    HyperLink *link;
    HyperDocPage *page = NULL;
    char *page_name;

    /* handle mouse wheel (Gregory Vanuxem) */
    if (event->window == gWindow->fMainWindow ||
        event->window == gWindow->fScrollWindow) {
        if (button == 4) {
            scrollUp();
            return;
        }
        else if (button == 5) {
            scrollDown();
            return;
        }
    }

    /* find page name from sub-window handle */
    link = getHyperLink(event);
    if (link == NULL) { /* user clicked on an inactive area */

    else
        text_y = table_top + front->height;
    *node = tn;
    gInLine = 0;
}

```

---

### 11.13.32 computeTitleExtent

— hypertext —

```

void computeTitleExtent(HyperDocPage *page) {
    right_margin_space = non_scroll_right_margin_space;
    page->title->height = twheight + gWindow->border_width;
    page->title->x = gWindow->border_width +
        2 * twwidth + (int) gWindow->border_width / 2;
    gLineNumber = page->title->next;
    initTitleExtents(page);
    text_y = top_margin + line_height;
    computeTextExtent(page->title->next);
    page->title->height = max(textHeight(page->title->next, Endtitle),
        twheight);
}

```

---

### 11.13.33 computeHeaderExtent

— hypertext —

```

void computeHeaderExtent(HyperDocPage *page) {
    /*

```

```

    * Hopefully we will soon be able to actually compute the needed height
    * for the header here
    */
int ty; /* UNUSED */
gExtentRegion = Header;
right_margin_space = non_scroll_right_margin_space;
initExtents();
ty = text_y = 3 * top_margin +
    line_height + max(page->title->height, twheight);
gLineNumber = page->header->next;
computeTextExtent(page->header->next);
page->header->height = textHeight(page->header->next, Endheader);
if (page->header->height) {
    page->header->height += 1 / 2 * line_height;
    page->top_scroll_margin = (gInLine) ? text_y : text_y - past_line_height;
    if (!(page->pageFlags & NOLINES))
        page->top_scroll_margin += (int) line_height / 2;
    page->top_scroll_margin += gWindow->border_width + 2 * top_margin;
}
else {
    page->top_scroll_margin = page->title->height + gWindow->border_width +
        2 * scroll_top_margin;
}
}

```

### 11.13.34 computeFooterExtent

— hypertext —

```

void computeFooterExtent(HyperDocPage * page) {
    if (page->footer) {
        gExtentRegion = Footer;
        right_margin_space = non_scroll_right_margin_space;
        initExtents();
        present_line_height = line_height;
        text_y = line_height;
        gLineNumber = page->footer->next;
        computeTextExtent(page->footer->next);
        page->footer->height = textHeight(page->footer->next, Endfooter);
        if (page->footer->height) {
            if (!(page->pageFlags & NOLINES))
                page->footer->height += (int) line_height / 2;
            page->bot_scroll_margin = gWindow->height -
                page->footer->height - bottom_margin
                - gWindow->border_width + top_margin;
        }
        else
            page->bot_scroll_margin = gWindow->height;
    }
}

```

---

### 11.13.35 computeScrollingExtent

— hypertext —

```
void computeScrollingExtent(HyperDocPage *page) {
    /* Check to see if there is a scrolling region */
    if (!page->scrolling) {
        return;
    }
    noop_count = 0;
    /* If there is then compute all the proper locations */
    gExtentRegion = Scrolling;
    right_margin_space = non_scroll_right_margin_space + gScrollbarWidth;
    initExtents();
    text_y = line_height;
    gLineNumber = page->scrolling->next;
    computeTextExtent(page->scrolling->next);
    /*
     * the following is an attempt to fix the bug where one cannot scroll
     * down to a bitmap that is opened at the bottom of a page.
     */
    /*
     * TTT trial if(!gInLine)
     */
    if (0) {
        text_y = text_y - past_line_height;
    }
    else if (present_line_height > line_height)
        text_y = text_y + present_line_height - line_height;
    page->scrolling->height = text_y;
}
```

---

### 11.13.36 startNewline

The startNewline function updates the current header node, and also allocates if needed memory for the next Line Header. It also assigns the first TextNode on the line to the structure, because this is the last time I will be able to do this.

— hypertext —

```
void startNewline(int distance, TextNode * node) {
    if (gLineNumber != NULL) {
        if (gTopOfGroupStack->center)
            centerNodes(gLineNumber, node);
        gLineNumber = node;
    }
    text_y += distance;
}
```

```

    past_line_height = distance;
    present_line_height = line_height;
    gInLine = 0;
}

```

---

### 11.13.37 centerNodes

The centerNodes goes through and centers all the text between the two given nodes.

— **hypertex** —

```

static void centerNodes(TextNode * begin_node, TextNode * end_node) {
    int begin_x, end_x, wmid_x, offset, mid_x;
    TextNode *node;
    end_x = text_x;
    begin_x = Xvalue(begin_node);
    mid_x = (int) (end_x + begin_x) / 2;
    wmid_x = (int) (right_margin + indent) / 2;
    if (mid_x > wmid_x)
        offset = 0;
    else
        offset = wmid_x - mid_x;
    for (node = begin_node; node != end_node; node = node->next)
        if (node->x > 0)
            node->x += offset;
}

```

---

### 11.13.38 punctuationWidth

— **hypertex** —

```

static int punctuationWidth(TextNode * node) {
    int twidth, width = strlen(node->data.text);
    twidth = XTextWidth(gTopOfGroupStack->cur_font, node->data.text, width);
    /* check to see if there was some space in front */
    if (gInLine && (node->space & FRONTSPACE))
        twidth += inter_word_space;
    return twidth;
}

```

---

### 11.13.39 inputStringWidth

— **hypertex** —

```
static int inputStringWidth(TextNode * node) {
    InputItem *item;
    int t_width;
    /** search the symbol table for the proper entry **/
    item = node->link->reference.string;
    /** Once I have gotten this far, I should just be able to calculate
        the width using the normal font **/
    t_width = (item->size + 1) * gInputFont->max_bounds.width + 10;
    return t_width;
}
```

---

#### 11.13.40 wordWidth

— hypertext —

```
static int wordWidth(TextNode * node) {
    int twidth, len = strlen(node->data.text);
    twidth = XTextWidth(gTopOfGroupStack->cur_font, node->data.text, len);
    if (node->space & FRONTSPACE)
        twidth += inter_word_space;
    return twidth;
}
```

---

#### 11.13.41 verbatimWidth

— hypertext —

```
static int verbatimWidth(TextNode * node) {
    int twidth, len = strlen(node->data.text);
    twidth = XTextWidth(gTopOfGroupStack->cur_font, node->data.text, len);
    if (node->space)
        twidth += inter_word_space;
    return twidth;
}
```

---

#### 11.13.42 widthOfDash

— hypertext —

```
static int widthOfDash(TextNode * node) {
    int num_dashes, twidth;
    num_dashes = strlen(node->data.text);
```

```

    if (num_dashes > 1)
        twidth = node->width = num_dashes * dash_width;
    else
        twidth = node->width = XTextWidth(gTopOfGroupStack->cur_font,
                                           node->data.text, 1);

    if (node->space)
        twidth += inter_word_space;
    return twidth;
}

```

### 11.13.43 textWidth

Return the gWindow->width in pixels of the given text node, when displayed

— **hypertex** —

```

int textWidth(TextNode * node, int Ender) {
    int twidth = 0, num_words;
    for (num_words = 0; node != NULL; num_words++, node = node->next) {
        if (Ender == Endtokens) {
            if (node->type == Endtokens)
                return twidth;
        }
        else if (node->type == Ender)
            return twidth;

#### 11.13.45 initExtents

The initExtents function initialize some text size variables

— **hypertex** —

```

void initExtents(void) {
    present_line_height = line_height;
    gInLine = 0;
    gInItem = 0;
    gInAxiomCommand = 0;
    item_indent = 0;
    gInDesc = 0;
    indent = left_margin;
    text_x = indent;
    gTopOfGroupStack->cur_font = gRmFont;
    gTopOfGroupStack->cur_color = gRmColor;
    right_margin = gWindow->width - right_margin_space;
    clearItemStack();
}

```

---

### 11.13.46 initTitleExtents

The initTitleExtents function initialize some title text size variables.

— **hypertex** —

```
void initTitleExtents(HyperDocPage * page) {
    present_line_height = line_height;
    gInLine = 0;
    gInAxiomCommand = 0;
    item_indent = 0;
    gInDesc = 0;
    indent = left_margin + page->title->x;
    text_x = indent;
    gTopOfGroupStack->cur_font = gRmFont;
    gTopOfGroupStack->cur_color = gRmColor;
    right_margin = gWindow->width - right_margin_space -
        gWindow->border_width - 2 * twwidth;
    clearItemStack();
}
```

—————

### 11.13.47 initText

The initText function initialize some text size variables.

— **hypertex** —

```
void initText(void) {
    normal_textHeight = gRmFont->ascent + gRmFont->descent;
    line_height = gRmFont->ascent + gRmFont->descent + inter_line_space;
    word_off_height = line_height - normal_textHeight;
    space_width = gRmFont->max_bounds.width;
}
```

—————

### 11.13.48 textHeight

The textHeight function returns the height of a piece of formatted text in pixels.

— **hypertex** —

```
int textHeight(TextNode * node, int Ender) {
    cur_height = 0;
    return textHeight1(node, Ender);
}
```

—————

**11.13.49 textHeight1**

The textHeight1 function is the recursive part of textHeight.

— **hypertex** —

```
static int textHeight1(TextNode * node, int Ender) {
    for (; node != NULL; node = node->next) {
        if (Ender == Endtokens) {
            if (node->type > -Endtokens)
                return cur_height;
        }
        else if (node->type == Ender)
            return cur_height;
        switch (node->type) {

            case Spadmemolink:
            case Spadcommand:
            case Spadgraph:
            case Unixcommand:
            case Space:
            case SimpleBox:
            case Radiobox:
                return node->x;
            default:
#ifdef DEBUG
                fprintf(stderr, "Xvalue did not know x value of type %d\n", node->type);
#endif
                return Xvalue(node->next);
        }
    }
    return 0;
}

```

---

### 11.13.52 trailingSpace

The trailingSpace function computes the length of the trailing spaces of a node.

— **hypertext** —

```
int trailingSpace(TextNode * node) {
    int space = 0;
    for (; node->type < Endtokens; node = node->next);
    if (node->type == Space)
        space += inter_word_space *
            (node->data.node != NULL ? atoi(node->data.node->data.text) : 1);
    return space;
}
```

---

### 11.13.53 insertBitmapFile

The insertBitmapFile function reads a bitmap file into memory.

— **hypertext** —

```
void insertBitmapFile(TextNode * node) {
    char *filename = node->data.text;
    int bm_width, bm_height;
    XImage *im;
    ImageStruct *image;
    if (*filename == ' ')
        filename++;
    if (node->image.pm == 0) {
        if (
            ((image = (ImageStruct *) hashFind(&gImageHashTable, filename))
             == NULL) || (getenv("HTCACHE"))) {
            /*
             * read the bitmap if not already in memory or if the environment
             * variable HTCACHE is set (NAG addition).
             */
            im = HTReadBitmapFile(gXDisplay, gXScreenNumber, filename,
                                  &bm_width, &bm_height);
            /** now add the image to the gImageHashTable **/
            image = (ImageStruct *) malloc(sizeof(ImageStruct), "ImageStruct");
            image->image.xi = im;
            image->width = image->image.xi->width;
            image->height = image->image.xi->height;
            image->filename =
                (char *) malloc(sizeof(char) * strlen(filename)+1, "Image Filename");
            /* strcpy(image->filename, filename); */
            sprintf(image->filename, "%s", filename);
            hashInsert(&gImageHashTable, (char *)image, image->filename);
        }
        node->width = image->width;
        node->height = image->height;
        node->image.xi = image->image.xi;
    }
}
```

}

---

### 11.13.54 insertPixmapFile

The insertPixmapFile function reads a pixmap file into memory.

— hypertext —

```

void insertPixmapFile(TextNode * node) {
    char *filename = node->data.text;
    int bm_width, bm_height, ret_val;
    XImage *xi;
    ImageStruct *image;

    if (*filename == ' ')
        filename++;
    if (node->image.xi == 0) {
        if ((image=(ImageStruct *)hashFind(&gImageHashTable, filename))==NULL) {
            ret_val = read_pixmap_file(gXDisplay, gXScreenNumber, filename, &xi,
                                      &bm_width, &bm_height);

            switch (ret_val) {
                case(-1):
                    gSwitch_to_mono = 1;
                    return;
                case BitmapFileInvalid:
                    fprintf(stderr, "File %s contains invalid bitmap data\n",
                            filename);
                    return;
                case BitmapOpenFailed:
                    fprintf(stderr, "couldn't open bitmap file %s\n", filename);
                    return;
                case BitmapNoMemory:
                    fprintf(stderr, "not enough memory to store bitmap\n");
                    return;
            }
            image = (ImageStruct *) malloc(sizeof(ImageStruct), "ImageStruct");
            image->width = bm_width;
            image->height = bm_height;
            image->filename = (char *)malloc(sizeof(char) *strlen(filename)+1,
                                           "insert_pixmap--filename");

            /* strcpy(image->filename, filename); */
            sprintf(image->filename, "%s", filename);
            image->image.xi = xi;
            hashInsert(&gImageHashTable, (char *)image, image->filename);
        }
        node->width = image->width;
        node->height = plh(image->height + inter_line_space);
        node->image.xi = image->image.xi;
    }
}

```

---

### 11.13.55 plh

The plh function calculates the closet value of line\_height  $\geq$  height.

— **hypertex** —

```
int plh(int height) {
    int rheight = height;
    if (gExtentRegion == Scrolling) {
        for (rheight = line_height; rheight < height; rheight += line_height)
            ;
    }
    return rheight;
}
```

---

## 11.14 Handling forms

A few routines used to help with form extents

### 11.14.1 computeFormPage

To solve the problem of improperly nested \em, I will have to keep and always initialize the top of the stack.

— **hypertex** —

```
void computeFormPage(HyperDocPage *page) {
    while (popGroupStack() >= 0);
    /*
     * The compute the text extents
     */
    formHeaderExtent(page);
    formFooterExtent(page);
    formScrollingExtent(page);
    gWindow->height = windowHeight(gWindow->page);
}
```

---

### 11.14.2 windowHeight

A simple function that returns the width needed to store show the number of columns given.

— **hypertex** —

```
int windowHeight(int cols) {
    return (left_margin + cols * space_width + non_scroll_right_margin_space);
}
```

---

### 11.14.3 windowHeight

— hypertext —

```
static int windowHeight(HyperDocPage *page) {
    int temp;
    temp = page->header->height + top_margin + bottom_margin;
    if (page->scrolling)
        temp += page->scrolling->height + page->footer->height;
    return (temp);
}
```

---

### 11.14.4 formHeaderExtent

— hypertext —

```
static void formHeaderExtent(HyperDocPage *page) {
    /*
     * Hopefully I will soon be able to actually compute the needed height
     * for the header here
     */
    gExtentRegion = Header;
    right_margin_space = non_scroll_right_margin_space;
    initExtents();
    text_y = top_margin + line_height;
    computeTextExtent(page->header->next);
    page->header->height = (gInLine) ? text_y : text_y - past_line_height;
    if (!(page->pageFlags & NOLINES))
        page->header->height += (int) line_height / 2;
    page->header->height += gWindow->border_width;
}
```

---

### 11.14.5 formFooterExtent

— hypertext —

```
static void formFooterExtent(HyperDocPage *page) {
    if (page->footer) {
        gExtentRegion = Footer;
        right_margin_space = non_scroll_right_margin_space;
        initExtents();
        computeTextExtent(page->footer->next);
        /*
         * I inserted the 2nd arg to textHeight below because it
         * was missing. Perhaps there is a better value for it.
         */
    }
```

```

    page->footer->height = textHeight(page->footer->next,
        page->footer->next->type);
    if ((!page->pageFlags & NOLINES))
        page->footer->height += (int) line_height / 2;
}
}

```

---

### 11.14.6 formScrollingExtent

— **hypertext** —

```

static void formScrollingExtent(HyperDocPage *page) {
    /*
     * Check to see if there is a scrolling region
     */
    if (page->scrolling) {
        /*
         * If there is then compute all the proper locations
         */
        gExtentRegion = Scrolling;

## 11.15 Managing the HyperDoc group stack

### 11.15.1 popGroupStack

This routine pops the top of the current group stack.

— **hypertext** —

```

int popGroupStack(void) {
    GroupItem *junk;
    /*
     * If the the stack has only a single item, then pop it anyway so the
     * user can see the problem
     */
    if (! gTopOfGroupStack->next)

```

```

        return -1;
    /* Else, Pop the thing */
    junk = gTopOfGroupStack;
    gTopOfGroupStack = gTopOfGroupStack->next;
    junk->next = NULL;
    free(junk);
    /* Now change the font to the cur_font and the cur_color */
    changeText(gTopOfGroupStack->cur_color, gTopOfGroupStack->cur_font);
    return 1;
}

```

---

### 11.15.2 pushGroupStack

— hypertext —

```

void pushGroupStack(void) {
    /*
     * This routine makes room by pushing a new item on the stack
     */
    GroupItem *newgp;
    newgp = (GroupItem *) malloc(sizeof(GroupItem), "Push Group Stack");
    newgp->cur_font = gTopOfGroupStack->cur_font;
    newgp->cur_color = gTopOfGroupStack->cur_color;
    newgp->center = gTopOfGroupStack->center;
    newgp->next = gTopOfGroupStack;
    gTopOfGroupStack = newgp;
}

```

---

### 11.15.3 initGroupStack

— hypertext —

```

void initGroupStack(void) {
    gTopOfGroupStack =
        (GroupItem *) malloc(sizeof(GroupItem), "Push Group Stack");
    gTopOfGroupStack->center = 0;
    gTopOfGroupStack->next = NULL;
    gTopOfGroupStack->cur_color = 0;
    gTopOfGroupStack->cur_font = NULL;
}

```

---

### 11.15.4 emTopGroup

— h<sub>yp</sub>ertex —

```
void emTopGroup(void) {
    if (! gTopOfGroupStack->next)
        pushGroupStack();
    gTopOfGroupStack->cur_color = gEmColor;
    gTopOfGroupStack->cur_font = gEmFont;
    changeText(gTopOfGroupStack->cur_color, gTopOfGroupStack->cur_font);
}
```

---

### 11.15.5 rmTopGroup

— h<sub>yp</sub>ertex —

```
void rmTopGroup(void) {
    if (! gTopOfGroupStack->next)
        pushGroupStack();
    gTopOfGroupStack->cur_color = gRmColor;
    gTopOfGroupStack->cur_font = gRmFont;
    changeText(gTopOfGroupStack->cur_color, gTopOfGroupStack->cur_font);
}
```

---

### 11.15.6 lineTopGroup

— h<sub>yp</sub>ertex —

```
void lineTopGroup(void) {
    if (! gTopOfGroupStack->next)
        pushGroupStack();
    gTopOfGroupStack->cur_color = gBorderColor;
    gTopOfGroupStack->cur_font = gRmFont;
    changeText(gTopOfGroupStack->cur_color, gTopOfGroupStack->cur_font);
}
```

---

### 11.15.7 bfTopGroup

— h<sub>yp</sub>ertex —

```
void bfTopGroup(void) {
```

```

/*
 * Just in case the person is tryin a \em without a grouping
 */
if (! gTopOfGroupStack->next)
    pushGroupStack();
gTopOfGroupStack->cur_color = gBfColor;
gTopOfGroupStack->cur_font = gBfFont;
changeText(gTopOfGroupStack->cur_color, gTopOfGroupStack->cur_font);
}

```

---

### 11.15.8 ttTopGroup

— hypertex —

```

void ttTopGroup(void) {
    if (! gTopOfGroupStack->next)
        pushGroupStack();
    gTopOfGroupStack->cur_color = gTtColor;
    gTopOfGroupStack->cur_font = gTtFont;
    changeText(gTopOfGroupStack->cur_color, gTopOfGroupStack->cur_font);
}

```

---

### 11.15.9 pushActiveGroup

— hypertex —

```

void pushActiveGroup(void) {
    pushGroupStack();
    gTopOfGroupStack->cur_font = gActiveFont;
    gTopOfGroupStack->cur_color = gActiveColor;
    changeText(gTopOfGroupStack->cur_color, gTopOfGroupStack->cur_font);
}

```

---

### 11.15.10 pushSpadGroup

— hypertex —

```

void pushSpadGroup(void) {
    pushGroupStack();
    gTopOfGroupStack->cur_font = gAxiomFont;
    gTopOfGroupStack->cur_color = gAxiomColor;
    changeText(gTopOfGroupStack->cur_color, gTopOfGroupStack->cur_font);
}

```

```
}

```

---

### 11.15.11 initTopGroup

```

— hypertext —

void initTopGroup(void) {
    /* clear the group stack */
    while (popGroupStack() >= 0)
        ;
    /* then set the colors to be normal */
    gTopOfGroupStack->cur_color = gRmColor;
    gTopOfGroupStack->cur_font = gRmFont;
    changeText(gTopOfGroupStack->cur_color, gTopOfGroupStack->cur_font);
}

```

---

### 11.15.12 centerTopGroup

```

— hypertext —

void centerTopGroup(void) {
    pushGroupStack();
    gTopOfGroupStack->center = 1;
}

```

---

### 11.15.13 copyGroupStack

```

— hypertext —

GroupItem *copyGroupStack(void) {
    GroupItem *newgp = NULL;
    GroupItem *first = NULL;
    GroupItem *prev = NULL;
    GroupItem *trace = gTopOfGroupStack;
    while (trace) {
        newgp = (GroupItem *) malloc(sizeof(GroupItem), "Copy Group Stack");
        newgp->cur_font = trace->cur_font;
        newgp->cur_color = trace->cur_color;
        newgp->center = trace->center;
        if (!first)
            first = newgp;
        else

```

```

        prev->next = newgp;
        prev = newgp;
        trace = trace->next;
    }
    if (newgp)
        newgp->next = NULL;
    return first;
}

```

---

#### 11.15.14 freeGroupStack

— hypertext —

```

void freeGroupStack(GroupItem *g) {
    GroupItem *trace = g;
    while (trace) {
        GroupItem *junk = trace;
        trace = trace->next;
        free(junk);
    }
}

```

---

### 11.16 Handle input, output, and Axiom communication

#### 11.16.1 makeRecord

— hypertext —

```

void makeRecord(void) {
    int i;
    for (i=0;i<input_file_count;i++){
        sendLispCommand("(|clearCmdCompletely|)");
        sendLispCommand("(setq |$testingSystem| T)");
        sendLispCommand("(setq |$printLoadMsgs| NIL)");
        sendLispCommand("(setq |$BreakMode| '|resume|)");
        sprintf(buf_for_record_commands,
            "(|inputFile2RecordFile| '|\"%s\\\"")",input_file_list[i]);
        fprintf(stderr,"%s\\n",buf_for_record_commands);
        sendLispCommand(buf_for_record_commands);
    }
    if (kill_spad){
        i = connectSpad();
        if (i != NotConnected && i != SpadBusy)
            send_int(spadSocket, KillLispSystem);
    }
}

```

### 11.16.2 verifyRecord

— hypertex —

```
void verifyRecord(void) {
    int i;
    for (i=0;i<input_file_count;i++){
        sendLispCommand("(clearCmdCompletely|)");
        sendLispCommand("(setq |$testingSystem| T)");
        sendLispCommand("(setq |$printLoadMsgs| NIL)");
        sendLispCommand("(setq |$BreakMode| '|resume|)");
        sprintf(buf_for_record_commands,
            "(|verifyRecordFile| '\"%s\\\"")",input_file_list[i]);
        fprintf(stderr,"%s\\n",buf_for_record_commands);
        sendLispCommand(buf_for_record_commands);
    }
    if (kill_spad) {
        i = connectSpad();
        if (i != NotConnected && i != SpadBusy)
            send_int(spadSocket, KillLispSystem);
    }
}
```

### 11.16.3 ht2Input

— hypertex —

```
void ht2Input(void) {
    HashTable *table;
    HashEntry *entry;
    int i;
    bsdSignal(SIGUSR2, SIG_IGN,RestartSystemCalls);
    gWindow = allocHdWindow();

    }
    putc(*str, pfile);
}
}

```

---

### 11.16.12 getSpadOutput

— **hypertex** —

```

void getSpadOutput(FILE *pfile, char *command, int com_type) {
    int n, i;
    char buf[1024];
    sendCommand(command, com_type);
    n = get_int(spadSocket);
    for (i = 0; i < n; i++) {
        get_string_buf(spadSocket, buf, 1024);
        fprintf(pfile, "%s\n", buf);
    }
    unescapeString(command);
}

```

---

### 11.16.13 getGraphOutput

THEMOS says: There is a problem here in that we issue the (—close—) and then go on. If this is the last command, we will soon send a SIGTERM and the whole thing will collapse maybe BEFORE the writing out has finished. Fix: Call a Lisp function that checks (with `\axiomOp{key} ps` and `grep`) the health of the viewport. We do this after the (—close—).

— **hypertex** —

```

void getGraphOutput(char *command, char *pagename, int com_type) {
    int n, i;
    char buf[1024];
    sendCommand(command, com_type);
    n = get_int(spadSocket);
    for (i = 0; i < n; i++) {
        get_string_buf(spadSocket, buf, 1024);
    }
    unescapeString(command);
    sprintf(buf,
        "(|processInteractive| '(|write| |%s| \"\">%s%d\" \"image\") NIL)\", \"%",
        pagename, example_number);
    sendLispCommand(buf);
    sendLispCommand("(|setViewportProcess|)");
    sendLispCommand("(|processInteractive| '(|close| (|%%| -3)) NIL)");
}

```

```

    sendLispCommand("(|waitForViewport|)");
    get_int(spadSocket);
}

```

---

#### 11.16.14 sendCommand

— hypertex —

```

static void sendCommand(char *command,int com_type) {
    char buf[1024];
    if (com_type != Spadsrc) {
        escapeString(command);
        sprintf(buf, "(|parseAndEvalToHypertex| '%s\\")", command);
        sendLispCommand(buf);
    }
    else {
        FILE *f;
        char name[512], str[512]/*, *c*/;
        sprintf(name, "/tmp/hyper%s.input", getenv("SPADNUM"));
        f = fopen(name, "w");
        if (f == NULL) {
            fprintf(stderr, "Can't open temporary input file %s\\n", name);
            return;
        }
        fprintf(f, "%s", command);
        fclose(f);
        sprintf(str, "(|parseAndEvalToHypertex| '\\")read %s\\")", name);
        sendLispCommand(str);
    }
}

```

---

#### 11.16.15 printPaste

— hypertex —

```

static void printPaste(FILE *pfile,char *realcom,char *command,
    char *pagename,int com_type) {
    fprintf(pfile, "\\begin{patch}{%sPatch%d}\\n", pagename, example_number);

    fflush(pfile);
}

```

## 11.17 X Window window initialization code

Initialize the X Window System.

### 11.17.1 initializeWindowSystem

— hypertext —

```
void initializeWindowSystem(void) {
    char *display_name = NULL;
    XColor fg, bg;
    Colormap cmap;
    Pixmap mousebits, mousemask;
    /* fprintf(stderr,"initx:initializeWindowSystem:entered\n");*/
    /* Try to open the display */
    /* fprintf(stderr,"initx:initializeWindowSystem:XOpenDisplay\n");*/
    if ((gXDisplay = XOpenDisplay(display_name)) == NULL) {
        fprintf(stderr, "(HyperDoc) Cannot connect to the X11 server!\n");
        exit(-1);
    }
    /* Get the screen */
    /* fprintf(stderr,"initx:initializeWindowSystem:DefaultScreen\n");*/
    gXScreenNumber = scrn = DefaultScreen(gXDisplay);
    /* fprintf(stderr,"initx:initializeWindowSystem:XGContextFromGC\n");*/
    server_font = XGContextFromGC(DefaultGC(gXDisplay, gXScreenNumber));
    /* Get the cursors we need. */
    /* fprintf(stderr,"initx:initializeWindowSystem:DefaultColormap\n");*/
    cmap = DefaultColormap(gXDisplay, gXScreenNumber);
    /* fprintf(stderr,"initx:initializeWindowSystem:WhitePixel\n");*/
    fg.pixel = WhitePixel(gXDisplay, gXScreenNumber);
    /* fprintf(stderr,"initx:initializeWindowSystem:XQueryColor\n");*/
    XQueryColor(gXDisplay, cmap, &fg);
    /* fprintf(stderr,"initx:initializeWindowSystem:BlackPixel\n");*/
    bg.pixel = BlackPixel(gXDisplay, gXScreenNumber);
    /* fprintf(stderr,"initx:initializeWindowSystem:XQueryColor2\n");*/
    XQueryColor(gXDisplay, cmap, &bg);
    /* fprintf(stderr,"initx:initializeWindowSystem:XCreateBitmapFromData 1\n");*/
    mousebits = XCreateBitmapFromData(gXDisplay,
        RootWindow(gXDisplay, gXScreenNumber),
        mouseBitmap_bits, mouseBitmap_width, mouseBitmap_height);
    /* fprintf(stderr,"initx:initializeWindowSystem:XCreateBitmapFromData 2\n");*/
    mousemask = XCreateBitmapFromData(gXDisplay,
        RootWindow(gXDisplay, gXScreenNumber),
        mouseMask_bits, mouseMask_width, mouseMask_height);
    /* fprintf(stderr,"initx:initializeWindowSystem:XCreateBitmapFromData 2\n");*/
    gActiveCursor = XCreatePixmapCursor(gXDisplay,
        mousebits, mousemask, &fg, &bg,
        mouseBitmap_x_hot, mouseBitmap_y_hot);
    /* fprintf(stderr,"initx:initializeWindowSystem:XCreateFontCursor\n");*/
}
```

```

    gNormalCursor = XCreateFontCursor(gXDisplay, XC_left_ptr);
/*    fprintf(stderr,"initx:initializeWindowSystem:XCreateFontCursor 2\n");*/
    gBusyCursor = XCreateFontCursor(gXDisplay, XC_watch);
/*    Now initialize all the colors and fonts */
/*    fprintf(stderr,"initx:initializeWindowSystem:ingItColorsAndFonts\n");*/
    ingItColorsAndFonts();
/*    fprintf(stderr,"initx:initializeWindowSystem:initText\n");*/
    initText();
/*    fprintf(stderr,"initx:initializeWindowSystem:exited\n");*/
}

```

### 11.17.2 initTopWindow

This routine is responsible for initializing a HyperDoc Window. At this point, all the fonts have been loaded, and X has been initialized. All I need worry about is starting up the window, and creating some of its children.

The initTopWindow function tries to start up a window with the page name. If the page name is NULL, it doesn't try to find it in the Hash Table, but rather just allocates a page of no name

— **hypertex** —

```

int initTopWindow(char *name) {
    HyperDocPage *page;
    XSetWindowAttributes wa;    /* The X attributes structure */
    HDWindow *old_win = gWindow;
    gWindow = allocHdWindow();
    if (name == NULL) {
        /** Then allocate an empty page, and assign it to gWindow->page */
        page = allocPage((char *) NULL);
    }
    else {
        /* Try to find the page in the page hash table */
        page = (HyperDocPage *) hashFind(gWindow->fPageHashTable, name);
        if (page == NULL) {
            fprintf(stderr,
                "(HyperDoc) Couldn't find page %s in page hash table \n",
                name);
            if (gParentWindow == NULL)
                /* Gaak, This is a start up error */
                exit(-1);
            else {
                gWindow = old_win;
                return -1;
            }
        }
    }
    /* First allocate memory for the new window structure */
    gWindow->page = page;
    if (old_win == NULL)
        openWindow(0);
}

```

```

    else
        openWindow(old_win->fMainWindow);
    getGCs(gWindow);
    XMapWindow(gXDisplay, gWindow->fMainWindow);
    hashInsert(&gSessionHashTable, (char *)gWindow,
               (char *) &gWindow->fMainWindow);
    changeText(gRmColor, gRmFont);
    wa.background_pixel = gBackgroundColor;
    XChangeWindowAttributes(gXDisplay, gWindow->fMainWindow, CWBackPixel, &wa);
    XChangeWindowAttributes(gXDisplay, gWindow->fScrollWindow, CWBackPixel, &wa);
    return 1;
}

```

### 11.17.3 openFormWindow

Create and initialize a form HyperDoc window.

— hypertex —

```

static void openFormWindow(void) {
    int x, y, width, height;
    unsigned int fwidth = 0, fheight = 0;
    unsigned int xadder = 0, yadder = 0;
    /*char *window_name = "HyperDoc";*/
    /*char *icon_name = "HT";*/
    XrmValue value;
    char *str_type[50];
    XSizeHints size_hints;
    int userSpecified = 0;
    char userdefaults[50], progdefaults[50];
    strcpy(progdefaults, "=950x450+0+0");
    if (XrmGetResource(rDB, "Axiom.hyperdoc.FormGeometry",
                     "Axiom.hyperdoc.FormGeometry", str_type, &value) == True)
    {
        strncpy(userdefaults, value.addr, (int) value.size);
        userSpecified = 1;
    }
    else
        strcpy(userdefaults, progdefaults);
    XGeometry(gXDisplay, gXScreenNumber, userdefaults, progdefaults,
              0, fwidth, fheight, xadder, yadder,
              &x, &y, &width, &height);
    gWindow->border_width = getBorderProperties();
    gWindow->width = 1;
    gWindow->height = 1;
    gWindow->fMainWindow =
        XCreateSimpleWindow(gXDisplay, RootWindow(gXDisplay, gXScreenNumber),
                           x, y, width, height, gWindow->border_width,
                           gBorderColor, WhitePixel(gXDisplay, gXScreenNumber));
    gWindow->fScrollWindow =
        XCreateSimpleWindow(gXDisplay, gWindow->fMainWindow, 1, 1, 1, 1, 0,
                           BlackPixel(gXDisplay, gXScreenNumber),

```

```

        WhitePixel(gXDisplay, gXScreenNumber));
makeScrollBarWindows();
makeTitleBarWindows();
setNameAndIcon();
XSelectInput(gXDisplay, gWindow->fScrollWindow, PointerMotionMask);
XSelectInput(gXDisplay, gWindow->fMainWindow,
    StructureNotifyMask | PointerMotionMask);
XDefineCursor(gXDisplay, gWindow->fMainWindow, gNormalCursor);
/* now give the window manager some hints */
size_hints.flags = 0;
size_hints.min_width = width;
size_hints.min_height = height;
size_hints.flags |= PMinSize;
size_hints.width = width;
size_hints.height = height;
size_hints.flags |= (userSpecified ? USSize : PSize);
size_hints.x = x;
size_hints.y = y;
size_hints.flags |= (userSpecified ? USPosition : PPosition);
XSetNormalHints(gXDisplay, gWindow->fMainWindow, &size_hints);
XFlush(gXDisplay);
}

```

—

#### 11.17.4 initFormWindow

— hypertext —

```

int initFormWindow(char *name, int cols) {
    XSetWindowAttributes wa;    /* The X attributes structure */
    /* First allocate memory for the new window structure */
    gWindow = allocHdWindow();
    openFormWindow();
    gWindow->width = windowWidth(cols);
    if (name == NULL) {
        /* Then allocate an empty page, and assign it to gWindow->page */
        gWindow->page = allocPage((char *) NULL);
    }
    else {
        /* Try to find the page in the page hash table */
        gWindow->page=(HyperDocPage *)hashFind(gWindow->fPageHashTable, name);
        if (gWindow->page == NULL) {
            fprintf(stderr, "Couldn't find page %s\n", name);
            return (-1);
        }
    }
    getGCs(gWindow);
    hashInsert(&gSessionHashTable, (char *)gWindow,
        (char *) &gWindow->fMainWindow);
    wa.background_pixel = gBackgroundColor;
    XChangeWindowAttributes(gXDisplay, gWindow->fMainWindow, CWBackPixel, &wa);
}

```

```

XChangeWindowAttributes(gXDisplay, gWindow->fScrollWindow, CWBackPixel, &wa);
return 1;
}

```

---

### 11.17.5 setNameAndIcon

— hypertex —

```

static void setNameAndIcon(void) {
    char *icon_name = "HyperDoc";
    char *s;
    Pixmap icon_pixmap;
    XWMHints wmhints;
    XClassHint ch;
    ch.res_name = "HyperDoc";
    ch.res_class = gArgv[0];
    for (s = gArgv[0] + strlen(gArgv[0]) - 1; s != gArgv[0]; s--) {
        if (*s == '/') {
            ch.res_class = s + 1;
            break;
        }
    }
    XSetClassHint(gXDisplay, gWindow->fMainWindow, &ch);
    XStoreName(gXDisplay, gWindow->fMainWindow, "HyperDoc");
    /* define and assign the pixmap for the icon */
    icon_pixmap =
        XCreateBitmapFromData(gXDisplay, gWindow->fMainWindow, ht_icon_bits,
                               ht_icon_width, ht_icon_height);
    wmhints.icon_pixmap = icon_pixmap;
    wmhints.flags = IconPixmapHint;
    XSetWMHints(gXDisplay, gWindow->fMainWindow, &wmhints);
    /* name the icon */
    XSetIconName(gXDisplay, gWindow->fMainWindow, icon_name);
}

```

---

### 11.17.6 getBorderProperties

— hypertex —

```

static int getBorderProperties(void) {
    char *bwidth;
    int bw;
    Colormap cmap;
    bwidth = "2";
    if (bwidth == NULL)
        bw = 1;
}

```

```

else {
    bw = atoi(bwidth);
    if (bw < 1) {
        fprintf(stderr,
            "%s: The line width value must be greater than zero\n",
            "Axiom.hyperdoc");
        bw = 1;
    }
}
/* Now try to find the user preferred border color */
if (DisplayPlanes(gXDisplay, gXScreenNumber) == 1)
    gBorderColor = BlackPixel(gXDisplay, gXScreenNumber);
else {
    cmap = DefaultColormap(gXDisplay, gXScreenNumber);
    gBorderColor = getColor("BorderColor", "Foreground",
        BlackPixel(gXDisplay, gXScreenNumber), &cmap);
}
return bw;
}

```

### 11.17.7 openWindow

Create and initialize the HyperDoc window.

— **hypertex** —

```

static void openWindow(Window w) {
    int x = 0, y = 0;
    /*int border_width = 2;*/
    unsigned int width = 1;
    unsigned int height = 1;
    unsigned int fwidth = 0, fheight = 0;
    unsigned int xadder = 0, yadder = 0;
    char *str_type[50];
    XrmValue value;
    char userdefaults[50], progdefaults[50];
    strcpy(progdefaults, "=700x450+0+0");
    if (XrmGetResource(rDB, "Axiom.hyperdoc.Geometry",
        "Axiom.hyperdoc.Geometry", str_type, &value) == True)
    {
        strncpy(userdefaults, value.addr, (int) value.size);
    }
    else
        strcpy(userdefaults, progdefaults);
    XGeometry(gXDisplay, gXScreenNumber, userdefaults, progdefaults,
        0, fwidth, fheight, xadder, yadder,
        &x, &y, (int *)&width, (int *)&height);
    gWindow->border_width = getBorderProperties();
    gWindow->fMainWindow =
        XCreateSimpleWindow(gXDisplay, RootWindow(gXDisplay, gXScreenNumber),
            x, y, width, height, gWindow->border_width,
            gBorderColor,

```

```

                                WhitePixel(gXDisplay, gXScreenNumber));
gWindow->fScrollWindow =
    XCreateSimpleWindow(gXDisplay, gWindow->fMainWindow, 1, 1, 1, 1, 0,
                        gBorderColor, WhitePixel(gXDisplay, gXScreenNumber));
makeScrollBarWindows();
makeTitleBarWindows();
/* Now set all the little properties for the top level window */
setNameAndIcon();
setSizeHints(w);
XSelectInput(gXDisplay, gWindow->fScrollWindow, PointerMotionMask);
XSelectInput(gXDisplay, gWindow->fMainWindow,
              StructureNotifyMask | PointerMotionMask);
XDefineCursor(gXDisplay, gWindow->fMainWindow, gNormalCursor);
}

```

### 11.17.8 setSizeHints

This routine gets and sets the size for a new window. If the `w` paramter is null, it means that this is the initial window. Thus the user preferences are checked. If this is not the first window, then the window `w` is used as a guideline, and the new window is placed on top of it.

— hypertext —

```

static void setSizeHints(Window w) {
    int x, y;
    unsigned int width, height;
    char userdefaults[50];
    char progdefaults[50];
    char *str_type[50];
    unsigned int fwidth = 0, fheight = 0;
    unsigned int xadder = 0, yadder = 0;
    int geo = 0;                /* return flag from XGetGeometry */
    unsigned int depth, bw=0;
    Window root;
    XSizeHints size_hints;
    XPoint xp;
    XrmValue value;
    size_hints.flags = 0;
    strcpy(progdefaults, "=600x450+0+0");
    if (w) {
        /*
         * The window should be queried for it's size and position. Then the
         * new window should be given almost the same locations
         */
        if (XGetGeometry(gXDisplay, w, &root, &x, &y, &width,
                        &height, &bw, &depth))
        {
            xp = getWindowPositionXY(gXDisplay, w);
            x = xp.x + 40;
            y = xp.y + 40;
            if (x < 0)

```

```

        x = 0;
    if (y < 0)
        y = 0;
    size_hints.flags |= (USSize | USPosition);
}
else {
    fprintf(stderr,
        "(HyperDoc) Error Querying window configuration: %ld.\n", w);
    x = y = 0;
    width = 600;
    height = 450;
    size_hints.flags |= (PSize | PPosition);
}
}
else {
    /* this is the first window, so lets try to find a nice spot for it */
    if (XrmGetResource(rDB, "Axiom.hyperdoc.Geometry",
        "Axiom.hyperdoc.Geometry",
        str_type, &value) == True)
    {
        strncpy(userdefaults, value.addr, (int) value.size);
        geo = XParseGeometry(userdefaults, &x, &y, &width, &height);
    }
    else
        strcpy(userdefaults, progdefaults);
    size_hints.flags |= (geo & (WidthValue | HeightValue)) ? USSize : PSize;
    size_hints.flags |= (geo & (XValue | YValue)) ? USPosition : PPosition;
    geo = XGeometry(gXDisplay, gXScreenNumber, userdefaults, progdefaults,
        bw, fwidth, fheight, xadder, yadder,
        &x, &y, (int *)&width, (int *)&height);
}
size_hints.x = x;
size_hints.y = y;
size_hints.width = width;
size_hints.height = height;
getTitleBarMinimumSize(&(size_hints.min_width), &(size_hints.min_height));
size_hints.flags |= PMinSize;
XSetNormalHints(gXDisplay, gWindow->fMainWindow, &size_hints);
/* just in case a hint isn't enough ... */
XFlush(gXDisplay);
}

```

### 11.17.9 getGCs

Create the graphics contexts to be used for all drawing operations.

— **hypertex** —

```

static void getGCs(HDWindow *window) {
    /*unsigned long valuemask = 0;*/
    XGCValues values;
    values.background = gBackgroundColor;
}

```

```

window->fStandardGC =
    XCreateGC(gXDisplay, window->fMainWindow, GCBackground, &values);
XSetLineAttributes(gXDisplay, window->fStandardGC, window->border_width,
                    LineSolid, CapButt, JoinMiter);
/* create the stipple for the gc */
stipple = XCreateBitmapFromData(gXDisplay,
    RootWindow(gXDisplay, gXScreenNumber),
    stipple_bits, stipple_width, stipple_height);
values.background = gInputBackgroundColor;
values.foreground = gInputForegroundColor;
values.font = gInputFont->fid;
if (values.font == server_font )
    window->fInputGC = XCreateGC(gXDisplay, window->fMainWindow,
        GCBackground | GCForeground, &values);
else {
    window->fInputGC = XCreateGC(gXDisplay, window->fMainWindow,
        GCBackground | GCForeground | GCFont, &values);
}
window->fCursorGC = XCreateGC(gXDisplay, window->fMainWindow, 0, NULL);
if (values.font != server_font)
    XSetFont(gXDisplay, window->fCursorGC, gInputFont->fid);
XSetBackground(gXDisplay, window->fCursorGC, gInputForegroundColor);
XSetForeground(gXDisplay, window->fCursorGC, gInputBackgroundColor);
window->fControlGC = XCreateGC(gXDisplay, window->fMainWindow, 0, NULL);
XSetBackground(gXDisplay, window->fControlGC, gControlBackgroundColor);
XSetForeground(gXDisplay, window->fControlGC, gControlForegroundColor);
}

```

---

### 11.17.10 loadFont

Load a font and store the information in the fontInfo parameter.

— **hypertex** —

```

static void loadFont(XFontStruct **fontInfo, char *fontname) {
    if ((*fontInfo = XLoadQueryFont(gXDisplay, fontname)) == NULL) {
        fprintf(stderr, "(HyperDoc) Cannot load font %s ; using default.\n",
            fontname);
        if ((*fontInfo = XQueryFont(gXDisplay,
            XGContextFromGC(DefaultGC(gXDisplay, gXScreenNumber)))) == NULL)
        {
            fprintf(stderr, "(HyperDoc) Cannot get default font ; exiting.\n");
            exit(-1);
        }
    }
}

```

---

### 11.17.11 ingItColorsAndFonts

This routine initializes all the colors and fonts that the user wishes to use. It checks for all the following properties in `$HOME/.Xdefaults`.

- Axiom.hyperdoc.ActiveColor
- Axiom.hyperdoc.Background
- Axiom.hyperdoc.EmphasizeColor
- Axiom.hyperdoc.EmphasizeFont
- Axiom.hyperdoc.Foreground
- Axiom.hyperdoc.InputBackground
- Axiom.hyperdoc.InputForeground
- Axiom.hyperdoc.SpadColor
- Axiom.hyperdoc.SpadFont

— **hypertex** —

```
static void ingItColorsAndFonts(void) {
    char property[256];
    char *prop = &property[0];
    char *str_type[50];
    XrmValue value;
    Colormap cmap;
    int ts;
    /** get the color map for the display **/
    /*  fprintf(stderr,"initx:ingItColorsAndFonts:entered\n");*/

            GCForeground | GCBackground, &gcv);
        if (font->fid != server_font)
            XSetFont(gXDisplay, gWindow->fStandardGC, font->fid);
    }
}

```

---

### 11.17.13 getColor

This routine checks the .Xdefaults file of the user for the specified color. If found it allocates a place in the color map for it. If not found, or if an error occurs, it writes an error message, and uses the given default value.

— hypertex —

```
static int getColor(char *name, char *class, int def, Colormap *map) {

---

### 11.20.2 getModifierMask

This routine returns the modifier mask associated to a key symbol.

— **hypertex** —

```

static unsigned int getModifierMask(KeySym sym) {
    unsigned int    i, mask;
    XModifierKeymap *mod;
    KeyCode         kcode;
    const int       masks[8] = {
        ShiftMask, LockMask, ControlMask,
        Mod1Mask, Mod2Mask, Mod3Mask, Mod4Mask, Mod5Mask
    };
    mod = XGetModifierMapping(gXDisplay);
    kcode = XKeysymToKeycode(gXDisplay, sym);
    if (mod) {
        for (i = 0; i < (8 * mod->max_keypermod); i++){
            if (!mod->modifiermap[i]) continue;
            else if (kcode == mod->modifiermap[i]){
                mask = masks[i / mod->max_keypermod];
                XFreeModifiermap(mod);
                return mask;
            }
        }
        XFreeModifiermap(mod);
    }
    return 0;
}

```

---

### 11.20.3 initKeyin

This routine initializes some of the variables needed by the input strings, and boxes.

— **hypertex** —

```
void initKeyin(void) {
    char *prop;
    unsigned int nlm;
    nlm = getModifierMask(XK_Num_Lock);
    UnsupportedModMask &= ~nlm;
    ModifiersMask &= ~nlm;
    /*
     * First set all the values for when the active cursor is in the window
     */
    in_cursor_height = 2;
    in_cursor_y = gInputFont->max_bounds.ascent +
        gInputFont->max_bounds.descent;
    in_cursor_width = gInputFont->max_bounds.width;
    /*
     * Now for when the cursor is empty
     */
    out_cursor_height = gInputFont->max_bounds.ascent +
        gInputFont->max_bounds.descent;
    out_cursor_y = 2;
    out_cursor_width = in_cursor_width;
    start_x = 5;
    start_y = gInputFont->max_bounds.ascent;
    /*
     * Find out How big I should make the simple boxes
     */
    simple_box_width = XTextWidth(gInputFont, "X", 1) + 5;
    prop = XGetDefault(gXDisplay, gArgv[0], "ProtectedQuit");
    if (prop == NULL) {
        protected_quit = (char *) malloc(strlen("ProtectedPage") + 1,
                                         "protected_quit");
        strcpy(protected_quit, "ProtectedPage");
    }
    else {
        protected_quit = (char *) malloc(strlen(prop) + 1, "protected_quit");
        strcpy(protected_quit, prop);
    }
}
```

— — —

## 11.21 Handle page macros

### 11.21.1 scanHyperDoc

This routine keeps scanning until it reaches it pops off 1 more right brace then left brace.

— **hypertex** —

```

void scanHyperDoc(void) {
    HDWindow *twin = gWindow;
    int ret_val;
    int number_of_left_braces = 1;
    gWindow = NULL;
    while (number_of_left_braces) {
        ret_val = getToken();
        if (ret_val == EOF && number_of_left_braces) {
            fprintf(stderr, "Scan_Hypertex: Unexpected End of File\n");
            longjmp(jmpbuf, 1);
        }
        switch (token.type) {
            case Page:
                fprintf(stderr, "scanHyperDoc: Unexpected Page Declaration\n");
                break;
            case NewCommand:
                fprintf(stderr, "scanHyperDoc: Unexpected Macro Declaration\n");
                break;
            case Lbrace:
                number_of_left_braces++;
                break;
            case Endpatch:
            case Rbrace:
                number_of_left_braces--;
                break;
            default:
                break;
        }
    }
    gWindow = twin;
}

```

---

## 11.21.2 number

— hypertex —

```

int number(char *str) {
    char *t = str;
    while (*t)
        if (!isdigit(*t++))
            return 0;
    return 1;
}

```

---

### 11.21.3 loadMacro

Parse a given macro given the pointer to the unloaded macro.

— **hypertex** —

```
static char *loadMacro(MacroStore *macro) {
    int ret_val;
    long start_fpos;
    int size = 0;
    char *trace;
    char *macro_buff;
    saveScannerState();
    cfile = findFp(macro->fpos);
    initScanner();
    /** First thing I should do is make sure that the name is correct **/
    getExpectedToken(NewCommand);
    getExpectedToken(Lbrace);
    getExpectedToken(Macro);
    if (strcmp(token.id, macro->name)) {
        /** WOW, Somehow I had the location of the wrong macro **/
        fprintf(stderr, "Expected macro name %s got insted %s in loadMacro\n",
            macro->name, token.id);
        longjmp(jmpbuf, 1);
    }
    getExpectedToken(Rbrace);
    /** Next I should check to see if I have any parameters **/
    getToken();
    if (token.type == Lsquarebrace) {
        /** The person is telling me the number of macros he is going to use **/
        getExpectedToken(Word);
        if (!number(token.id)) {
            fprintf(stderr, "loadMacro: Expected A Value Instead Got %s\n",
                token.id);
            longjmp(jmpbuf, 1);
        }
        /** if it is a number, then I should store it in the parameter number
            member of the macro structure **/
        macro->number_parameters = atoi(token.id);
#ifdef DEBUG
        fprintf(stderr,
            "The number of parameters is %d\n", macro->number_parameters);
#endif
        getExpectedToken(Rsquarebrace);
        getToken();
    }
    else
        macro->number_parameters = 0;
    /** Now I should be able to check the token, and insure that I have read
        a leftbrace, then the string will follow ****/
    if (token.type != Lbrace) {
        /** The macro is not in a group, uh oh **/
        fprintf(stderr, "loadMacro:Expected a Left Brace got type %d\n",
            token.type);
        longjmp(jmpbuf, 1);
    }
}
```

```

    }
    start_fpos = fpos;
    scanHyperDoc();
    ret_val = fseek(cfile, macro->fpos.pos + start_fpos, 0);
    size = fpos - start_fpos;
    macro_buff = (char *) malloc((size + 1) * sizeof(char), "Macro_buf");
    for (size = 0, trace = macro_buff; size < fpos - (start_fpos) - 1; size++)
        *trace++ = getc(cfile);
    *trace = '\0';
    macro->loaded = 1;
    restoreScannerState();
    return macro_buff;
}

```

---

#### 11.21.4 initParameterElem

— hypertext —

```

ParameterList initParameterElem(int number) {
    ParameterList new;
    int count;
    /** allocate the space needed **/
    new = (ParameterList) malloc(sizeof(struct parameter_list_type),
                                "ParameterList");
    /** now allocate the memory for the pointers to the parameters **/
    if (number) {
        new->list = (char **) malloc(number * sizeof(char *), "Parameter List");
        /** initialize my pointers **/
        for (count = 0; count < number; count++)
            (new->list)[count] = NULL;
    }
    new->number = number;
    return new;
}

```

---

#### 11.21.5 pushParameters

— hypertext —

```

int pushParameters(ParameterList new) {
    if (new == NULL) {
        fprintf(stderr, "Tried pushing a null list onto the parameter stack\n");
        longjmp(jmpbuf, 1);
    }
    new->next = parameters;
    parameters = new;
}

```

```

    return 1;
}

```

---

### 11.21.6 popParameters

Simply pops the top of the parameter list, being good and freeing all the memory.

— **hypertex** —

```

int popParameters(void) {
    ParameterList old;
    int count;
    if (!parameters) {
        return 0;
    }
    old = parameters;
    parameters = old->next;
    /** Free the parameter text and pointers **/
    if (old->number > 0) {
        for (count = 0; count < old->number; count++)
            if ( (old->list)[count] ) free((char *) (old->list)[count]);
        free(old->list);
    }
    free(old);
    return 1;
}

```

---

### 11.21.7 parseMacro

This routine loads a macro if needed, and then parses it from the string.

— **hypertex** —

```

int parseMacro(void) {
    MacroStore *macro;
    int s;
    curr_node->type = Macro;
    curr_node->space = token.id[-1];
    curr_node->next = allocNode();
    curr_node = curr_node->next;
    macro = (MacroStore *) hashFind(gWindow->fMacroHashTable, token.id);
    if (macro != NULL) {
        if (!macro->loaded)
            macro->macro_string = loadMacro(macro);
        getParameterStrings(macro->number_parameters, macro->name);
        parseFromString(macro->macro_string);
        if (gEndedPage) {
            s = curr_node->type;
            curr_node->type = Endmacro;
            curr_node->next = allocNode();
        }
    }
}

```

```

        curr_node = curr_node->next;
        curr_node->type = s;
    }
    else
        curr_node->type = Endmacro;
    if (popParameters())
        return 1;
    else {
        fprintf(stderr,
            "parseMacro: Tried to pop an empty paramter stack\n");
        longjmp(jmpbuf, 1);
    }
}
else {
    fprintf(stderr, "parseMacro: Unknown keyword %s\n", token.id);
    longjmp(jmpbuf, 1);
}
}

```

---

### 11.21.8 getParameterStrings

— hypertext —

```

static void getParameterStrings(int number, char * macro_name) {
    static char buffer[4096];
    char *buffer_pntr;
    int count;
    int lbrace_counter;
    char c;
    int size;
    ParameterList new = initParameterElem(number);
    int pnum;
    char pnum_chars[5];
    int pc;
    if (!number) {                /* nothing to be done */
        pushParameters(new);
        return;
    }
    for (count = 0; count < number; count++) {
        getToken();
        if (token.type != Lbrace) {
            /** The macro is not in a group, uh oh **/
            fprintf(stderr, "Wrong number of arguments to the macro %s\n",
                macro_name);
            jump();
        }
    }
    for (lbrace_counter = 1, buffer_pntr = buffer;
        lbrace_counter;) {
        switch (c = getChar()) {
            case EOF:

```

```

    fprintf(stderr, "GetParameterStrings: Unexpected EOF\n");
    longjmp(jmpbuf, 1);
case '}' :
    lbrace_counter--;
    if (lbrace_counter)
        *buffer_pntr++ = c;
    break;
case '{' :
    lbrace_counter++;
    *buffer_pntr++ = c;
    break;
case '#' :
    /* uh oh, I have a paramter reference inside a paramter */
    /* get the number */
    if (parameters == NULL) {
        *buffer_pntr++ = c;
        break;
    }
    if (
        ((buffer_pntr > buffer + 1) &&
         *(buffer_pntr - 1) == '\\') &&
        *(buffer_pntr - 2) != '\\') ||
        ((buffer_pntr > buffer) &&
         *(buffer_pntr - 1) == '\\')) {
        /* I had a \# */
        *buffer_pntr++ = c;
    }
    else {
        c = getChar();
        for (pc = 0; numeric(c); pc++) {
            pnum_chars[pc] = c;
            c = getChar();
        }
        ungetChar(c);
        pnum_chars[pc] = '\\0';
        pnum = atoi(pnum_chars);
        pc = 0;
        /* Now copy the paramter */
        while ((parameters->list)[pnum - 1][pc] != '\\0')
            *buffer_pntr++ = (parameters->list)[pnum - 1][pc++];
    }
    break;
default:
    *buffer_pntr++ = c;
    break;
}

}
*buffer_pntr = '\\0';
/** Now add it to the current parameter list **/
size = strlen(buffer) + 1;
new->list[count] = (char *) malloc(size, "Parameter Strings");
strcpy(new->list[count], buffer);
}
pushParameters(new);

```

```

    return ;
}

```

---

### 11.21.9 parseParameters

```

    — hypertex —
void parseParameters(void) {
    int value;
    if (!number(token.id)) {
        fprintf(stderr,
            "Parse_parameter: Error Expected a number, got %s instead\n",
            token.id);
        longjmp(jmpbuf, 1);
    }
    if ((value = atoi(token.id)) > parameters->number) {
        /** had a bad parameter number **/
        fprintf(stderr,
            "Parse_parameter: Had a bad parameter number %d\n", value);
        longjmp(jmpbuf, 1);
    }
    parseFromString((parameters->list)[value - 1]);
    curr_node->type = Endparameter;
    return;
}

```

---

## 11.22 Memory management routines

### 11.22.1 freeIfNonNULL

```

    — hypertex —
static void freeIfNonNULL(void *p) {
    if (p){
        free(p);
    }
}

```

---

### 11.22.2 allocHdWindow

Allocate an HDWindow Structure and initialize it.

— hypertex —

```

HDWindow *allocHdWindow(void) {
    HDWindow *w = (HDWindow *) malloc(sizeof(HDWindow), "HDWindow");
    w->fMemoStack = (HyperDocPage **)
        malloc(MaxMemoDepth * sizeof(HyperDocPage *), "Memo Stack");
    w->fDownLinkStack = (HyperDocPage **)
        malloc(MaxDownlinkDepth * sizeof(HyperDocPage *), "downlink stack");
    w->fDownLinkStackTop =
        (int *) malloc(MaxDownlinkDepth * sizeof(int), "top downlink stack");
    w->fAxiomFrame = 0;
    initPageStructs(w);
    /* Now I initialize the hash tables for the page */
    w->fCondHashTable = (HashTable *) malloc(sizeof(HashTable), "cond hash");
    hashInit(
        w->fCondHashTable,
        CondHashSize,
        (EqualFunction) stringEqual,
        (HashcodeFunction) stringHash);
    w->fPasteHashTable = (HashTable *) malloc(sizeof(HashTable), "paste hash");
    hashInit(
        w->fPasteHashTable,
        PasteHashSize,
        (EqualFunction) stringEqual,
        (HashcodeFunction) stringHash);
    w->fPageHashTable = hashCopyTable(&init_page_hash);
    w->fPatchHashTable = hashCopyTable(&init_patch_hash);
    w->fMacroHashTable = hashCopyTable(&init_macro_hash);
    gWindow = w;
    makeSpecialPages(w->fPageHashTable);
    w->fDisplayedCursor = 0;
    return w;
}

```

### 11.22.3 freeHdWindow

— hypertext —

```

void freeHdWindow(HDWindow *w) {
    if (w) {
        free(w->fMemoStack);
        free(w->fDownLinkStack);
        free(w->fDownLinkStackTop);
        /*

        free(cond);
    }
}

```

---

**11.22.9 allocPage**

Allocate a new HyperDoc page.

— hypertext —

```

HyperDocPage *allocPage(char *name) {
    HyperDocPage *page;
    page = (HyperDocPage *) halloc(sizeof(HyperDocPage), "HyperDocPage");
}

```

```

page->name = name;
page->header = page->scrolling = page->footer = page->title = NULL;
page->scroll_off = 0;
page->sock = NULL;
page->box_hash = page->depend_hash = NULL;
page->fLinkHashTable =
    (HashTable *) malloc(sizeof(HashTable), "Page->fLinkHashTable");
page->input_list = page->currentItem = NULL;
page->pageFlags = 0000000;
page->filename = NULL;
page->helpPage = allocString(TopLevelHelpPage);
page->radio_boxes = NULL;
page->button_list = NULL;
page->s_button_list = NULL;
return page;
}

```

### 11.22.10 freePage

This routine now checks for an environment variable NOFREE. If found it returns. At least, that's what the comment claims but I see no code to implement this. It's not a bad idea though.

— hypertext —

```

void freePage(HyperDocPage *page) {
    if (page == NULL)
        return;
    switch (page->type) {
    case U1UnknownPage:
    case UnknownPage:
    case ErrorPage:
    case Unixfd:
    case SpadGen:
    case Normal:
        /*
         * if(page->name) free(page->name); if(page->filename)
         * free(page->filename);
         */
        freeNode(page->scrolling, 0);
        freeNode(page->header, 0);
        freeNode(page->footer, 0);
        freeNode(page->title, 0);
        freeButtonList(page->s_button_list);
        freeButtonList(page->button_list);
    /*
        if (page->sock != NULL)
            free(page->sock);
    */
        freeHash(page->depend_hash, (FreeFunction)freeDepend);
    /* TTT line below causes freeing of freed memory and freed memory reads
        links should have been freed by the recursive freeNode's above
    */
    }
}

```

```

    (cf.freeNode)
    this is apparently because we are called from freeHdWindow
    and we had made a call to free w->fWindowHashTable which is made
    to point to the same thing so we do it HERE not THERE
    */
    freeHash(page->fLinkHashTable, (FreeFunction)dontFree);
    freeHash(page->box_hash, (FreeFunction)freeInputBox);
    freeInputList(page->input_list);
    freeRadioBoxes(page->radio_boxes);
    free(page->helppage);
    free(page);
    break;
case UnloadedPageType:
    break;
default:
    /* fprintf(stderr, "Unknown Page type: %d\n", page->type); */
    break;
}
}

```

---

### 11.22.11 freePaste

— hypertext —

```

static void freePaste(PasteNode *paste, short int des) {
    if (paste) {
        freeGroupStack(paste->group);
        freeItemStack(paste->item_stack);
        freeNode(paste->arg_node, des);
        free(paste);
    }
}

```

---

### 11.22.12 freePastebutton

— hypertext —

```

static void freePastebutton(TextNode *node, short int des) {
    /*
     * if I am freeing from within parse patch, then I have to do some
     * special things first
     */
    /* the following seems to be unused */
    if (gActiveWindow == node->link->win)
        gActiveWindow = -1;
    if (des) {

```

```

PasteNode *paste;
paste = (PasteNode *) hashFind(gWindow->fPasteHashTable, node->data.text);
if (!paste->haspaste) {
    /* squash this thing */
    hashDelete(gWindow->fPasteHashTable, (char *)node->data.text);
    freePaste(paste, des);
    hashDelete(gWindow->page->fLinkHashTable, (char *) &node->link->win);
    XDestroyWindow(gXDisplay, node->link->win);
}
else
    paste->hasbutton = 0;
}
freeIfNonNULL(node->data.text);
}

```

---

### 11.22.13 freePastearea

— hypertext —

```

static void freePastearea(TextNode *node, short int des) {
    if (des) {
        PasteNode *paste;
        paste = (PasteNode *) hashFind(gWindow->fPasteHashTable, node->data.text);
        if (paste) {
            if (!paste->hasbutton) {
                /* squash this thing */
                hashDelete(gWindow->fPasteHashTable, node->data.text);
                freePaste(paste, des);
            }
            else
                paste->haspaste = 0;
        }
    }
    freeIfNonNULL(node->data.text);
}

```

---

### 11.22.14 freeString

— hypertext —

```

void freeString(char *str) {
    freeIfNonNULL(str);
}

```

---

**11.22.15 freeDepend**

— hypertext —

```
static void freeDepend(SpadcomDepend *sd) {
    freeIfNonNULL((char *) sd);
}
```

---

**11.22.16 dontFree**

— hypertext —

```
static void dontFree(void *link) {
    return;
}
```

---

**11.22.17 freeLines**

— hypertext —

```
static void freeLines(LineStruct *lines) {
    if (lines->prev != NULL)
        lines->prev->next = NULL;
    while (lines != NULL) {
        LineStruct *del;
        del = lines;
        lines = lines->next;
        free(del->buffer);
        free(del);
    }
}
```

---

**11.22.18 freeInputItem**

— hypertext —

```

    newbl->next = NULL;
    return newbl;
}

```

---

**11.22.29 freeButtonList**

— hypertext —

```

void freeButtonList(ButtonList *bl) {
    while (bl) {
        ButtonList *nbl = bl->next;
        free(bl);
        bl = nbl;
    }
}

```

---

**11.22.30 resizeBuffer**

Resizable static buffers.

— hypertext —

```

char *resizeBuffer(int size, char *oldBuf, int *oldSize) {
    char *newBuf;
    int newSize;
    if (size <= *oldSize)
        return oldBuf;
    newSize = size + BufferSlop;
    newBuf = (char *) halloc(newSize, "Buffer");
    memset(newBuf, '\0', newSize);
    if (oldBuf) {
        memcpy(newBuf, oldBuf, *oldSize);
        free(oldBuf);
    }
    *oldSize = newSize;
    return newBuf;
}

```

---

## 11.23 Page parsing routines

### 11.23.1 PushMR

```

      — hypertex —
static void PushMR(void) {
    MR_Stack *newStackItem =
        (MR_Stack *) halloc(sizeof(MR_Stack), "Mode Region Stack");
    newStackItem->fParserMode = gParserMode;
    newStackItem->fParserRegion = gParserRegion;
    newStackItem->fNext = top_mr_stack;
    top_mr_stack = newStackItem;
}

```

---

### 11.23.2 PopMR

```

      — hypertex —
static void PopMR(void) {
    MR_Stack *old = top_mr_stack;
    if (old == NULL) {
        fprintf(stderr,
            "(HyperDoc) Parser Error: Tried to pop empty MR Stack\n");
        exit(-1);
    }
    else {
        gParserMode = old->fParserMode;
        gParserRegion = old->fParserRegion;
        top_mr_stack = old->fNext;
        free(old);
    }
}

```

---

### 11.23.3 loadPage

```

      — hypertex —
void loadPage(HyperDocPage *page) {
    if (page->type == UnloadedPageType) {
        HyperDocPage *new_page;
        initScanner();
        new_page = formatPage((UnloadedPage *)page);
        gWindow->page = new_page;
        /* free(page); */
    }
}

```

```

        page = new_page;
    }
}

```

---

### 11.23.4 displayPage

Display a HyperDoc page with the given name, parsing it if needed.

— hypertext —

```

void displayPage(HyperDocPage *page) {
    HyperDocPage *new_page;
    XUnmapSubwindows(gXDisplay, gWindow->fMainWindow);
    XUnmapSubwindows(gXDisplay, gWindow->fScrollWindow);
    XFlush(gXDisplay);
    if (setjmp(jmpbuf)) {
        /*
         * since I did not finish formatting the page, let me get rid of what
         * I had
         */
        freePage(formatpage);
        /* Replace the buggy page with what I started with */
        hashReplace(gWindow->fPageHashTable, (char *)page, formatpage->name);
        if (!strcmp(formatpage->name, "ErrorPage")) {
            fprintf(stderr, "(HyperDoc) Oops the error page is buggy\n");
            exit(-1);
        }
        gWindow->page = page =
            (HyperDocPage *) hashFind(gWindow->fPageHashTable, "ErrorPage");
        if (page == NULL) {
            fprintf(stderr, "(HyperDoc) No error page found, exiting\n");
            exit(-1);
        }
        resetConnection();
    }
    if (page->type == UnloadedPageType || page->type == ErrorPage) {
        /* Gack! (page should be a union!) */
        initScanner();
        new_page = formatPage((UnloadedPage *)page);
        gWindow->page = new_page;
        /* free(page); */
        page = new_page;
    }
    showPage(page);
}

```

---

### 11.23.5 formatPage

Parse a given HyperDoc Page, from the top.

— **hypertext** —

```
static HyperDocPage *formatPage(UnloadedPage *ulpage) {
    /*int ret_val;*/
    HyperDocPage *page = allocPage(ulpage->name);
    /*
     * In case of an error I will have to get at this page so I can free the
     * waisted memory
     */
    formatpage = page;
    page->type = Normal;
    hashReplace(gWindow->fPageHashTable, (char *)page, ulpage->name);
    cfile = findFp(ulpage->fpos);
    page->filename = allocString(ulpage->fpos.name);
    parsePage(page);
    return page;
}

/* parse the HyperDoc statements in the given string */
```

---

### 11.23.6 parseFromString

— **hypertext** —

```
void parseFromString(char *str) {
    saveScannerState();
    last_ch = NoChar;
    last_token = 0;
    inputString = str;
    inputType = FromString;
    parseHyperDoc();
    restoreScannerState();
}
```

---

### 11.23.7 parseTitle

— **hypertext** —

```
static void parseTitle(HyperDocPage *page) {
    TextNode *node;
    PushMR();
    gParserRegion = Title;
    getExpectedToken(Lbrace);
    node = allocNode();
```

```

    page->title = node;
    node->type = Titlenode;
    node->next = allocNode();
    node = node->next;
    node->type = Center;
    node->next = allocNode();
    curr_node = node->next;
    parseHyperDoc();
    curr_node->type = Endcenter;

    PopMR();
}

```

---

### 11.23.8 parseHeader

— hypertext —

```

static void parseHeader(HyperDocPage *page) {
    TextNode *node;
    PushMR();
    gParserRegion = Header;
    node = allocNode();
    page->header = node;
    node->type = Headernode;
    node->next = allocNode();
    curr_node = node->next;
    parseHyperDoc();
}

/*
 * parse a page from the top level
 */

```

---

### 11.23.9 initParsePage

Parse a page from the top level.

— **hypertext** —

```
static void initParsePage(HyperDocPage *page) {
    gEndedPage = gInDesc = gStringValueOk = gInIf =
        gInButton = gInOptional = gInVerbatim = gInPaste = gInItems =
        gInSpadsrc = FALSE;
    example_number = 1;
    cur_page = page;
    gParserMode = AllMode;
    /* Now I should set the input list to be null */
    freeInputList(page->input_list);
    page->input_list = page->currentItem = NULL;
    initTopGroup();
    clearBeStack();
    cur_spadcom = NULL;
    gLinkHashTable = page->fLinkHashTable;
    hashInit(
        gLinkHashTable,
        LinkHashSize,
        (EqualFunction) windowEqual,
        (HashcodeFunction) windowCode);
    gPageBeingParsed = page;
}
```

---

### 11.23.10 initParsePatch

— **hypertext** —

```
void initParsePatch(HyperDocPage *page) {
    gEndedPage = gInDesc = gStringValueOk = gInIf =
        gInButton = gInOptional = gInVerbatim = gInPaste = gInItems =
        gInSpadsrc = FALSE;
    gParserMode = AllMode;
    gParserRegion = Scrolling;
    initTopGroup();
    clearBeStack();
    cur_spadcom = NULL;
    gLinkHashTable = page->fLinkHashTable;
    gPageBeingParsed = page;
}
```

---

**11.23.11 parsePage**— **hypertex** —

```
static void parsePage(HyperDocPage *page) {
    initParsePage(page);
    /* Get the name of the page */
    getExpectedToken(Page);
    getExpectedToken(Lbrace);
    getExpectedToken(Word);
    if (page->name == NULL)
        page->name = allocString(token.id);
    getExpectedToken(Rbrace);
    /* parse the title */
    gWindow->fDisplayedWindow = gWindow->fMainWindow;
    parseTitle(page);
    /*
     * Now start parsing the header region
     */
    parseHeader(page);
}

/*
 */
```

—————→

**11.23.12 parseHyperDoc**

The general HyperDoc parsing function. expects to see anything. This function will parse until it sees either:

1. A new page starting
2. An end of file
3. a closing bracket “}”

— **hypertex** —

```
void parseHyperDoc(void) {
    TextNode *node = NULL /*, *save_node = NULL, *arg_node = NULL*/ ;
    for(;;) {
        ret_val = getToken();
        if (ret_val == EOF)

        curr_node->type = Endheader;
        curr_node->next = NULL;
        PopMR();
        gPageBeingParsed->scrolling = NULL;
    }
}

```

```

        gPageBeingParsed->footer = NULL;
    }
}

```

---

### 11.23.18 parseReplacepage

— hypertext —

```

static void parseReplacepage(void) {
    getExpectedToken(Lbrace);
    getToken();
    replace_page = allocString(token.id);
    getExpectedToken(Rbrace);
}

```

---

### 11.23.19 windowEqual

Hash functions for active link windows.

— hypertext —

```

int windowEqual(Window *w1, Window *w2) {
    return *w1 == *w2;
}

```

---

### 11.23.20 windowCode

Hash code for a window.

— hypertext —

```

int windowCode(Window *w, int size) {
    return (*w) % size;
}

```

---

### 11.23.21 windowId

— hypertext —

```

char *windowId(Window w) {
    char *ret;
    char buff[32];
}

```

```

    int length;
    sprintf(buff, "%ld", w);
    length = strlen(buff);
    ret = (char *) malloc(length * sizeof(char) + 1, "windowid");
    strcpy(ret, buff);
    return (ret);
}

```

### 11.23.22 readHtDb

This procedure reads the ht database. It makes repeated calls to dbFileOpen, and while the returned pointer is not null, it continues to read the presented data base files.

— **hypertext** —

```

void readHtDb(HashTable *page_hash, HashTable *macro_hash,
              HashTable *patch_hash) {
    FILE *db_fp;
    char dbFile[256];
    int i = 0;
    gDatabasePath = NULL;
    hashInit(
        page_hash,
        PageHashSize,
        (EqualFunction) stringEqual,
        (HashcodeFunction) stringHash);
    hashInit(
        macro_hash,
        MacroHashSize,
        (EqualFunction) stringEqual,
        (HashcodeFunction) stringHash);
    hashInit(
        patch_hash,
        PatchHashSize,
        (EqualFunction) stringEqual,
        (HashcodeFunction) stringHash);
    /* Lets initialize the FileHashTable */
    hashInit(
        &ht_gFileHashTable,
        htfhSize,
        (EqualFunction) stringEqual,
        (HashcodeFunction) stringHash);
    while ((db_fp = dbFileOpen(dbFile)) != NULL) {
        i++;
        readHtFile(page_hash, macro_hash, patch_hash, db_fp, dbFile);
        fclose(db_fp);
    }
    if (!i) {
        fprintf(stderr,
            "(HyperDoc) readHtDb: No %s file found\n", dbFileName);
        exit(-1);
    }
}

```

```

    freeHash(&ht_gFileHashTable, (FreeFunction)freeString);
}

```

### 11.23.23 readHtFile

This procedure reads a single HyperDoc database file. It is passed an already initilaized file pointer. It reads the whole file, updating the page hash, or the macro hash only when a previous entry with the same name is not found

— **hypertex** —

```

static void readHtFile(HashTable *page_hash, HashTable *macro_hash,
                      HashTable *patch_hash, FILE *db_fp, char *dbFile) {
    char filename[256];
    char *fullname = filename;
    UnloadedPage *page;
    MacroStore *macro;
    PatchStore *patch;
    int pages = 0, c, mtime, ret_val;
    struct stat fstats;
    /*fprintf(stderr,"parse-aux:readHtFile: dp_file=%s\n",dbFile);*/
    cfile = db_fp;
    initScanner();
    ret_val = strlen(dbFile) - 1;
    for (; ret_val >= 0; ret_val--)
        if (dbFile[ret_val] == '/') {
            dbFile[ret_val] = '\0';
            break;
        }
    c = getc(db_fp);
    do {
        if (c == '\t') {

    link->reference.node = link_node;
    hashInsert(gLinkHashTable, (char *)link, (char *)&link->win);
    return link;
}
return 0;
}

```

---

### 11.23.25 makePasteWindow

— hypertext —

```

HyperLink *makePasteWindow(PasteNode *paste) {
    HyperLink *link;
    XSetWindowAttributes at;
    if (!make_input_file) {
        link = (HyperLink *) malloc(sizeof(HyperLink), "HyperLink");
        if (link == NULL) {
            fprintf(stderr,
                "(HyperDoc) Ran out of memory allocating a hypertext link!\n");
            exit(-1);
        }
        at.cursor = gActiveCursor;
        at.event_mask = ButtonPress;
        link->win = XCreateWindow(gXDisplay, gWindow->fDisplayedWindow,
                                0, 0, 100, 100, 0,
                                0, InputOnly, CopyFromParent,
                                CWEventMask | CWCursor, &at);

        link->type = Pastebutton;
        link->x = link->y = 0;
        link->reference.paste = paste;
        hashInsert(gLinkHashTable, (char *)link, (char *) &link->win);
        return link;
    }
    return 0;
}

```

---

### 11.23.26 makeSpecialPage

Create a HyperDoc page structure with the given type and name.

— **hypertex** —

```
static HyperDocPage *makeSpecialPage(int type, char *name) {
    HyperDocPage *page = allocPage(name);
    if (page == NULL) {
        fprintf(stderr, "(HyperDoc) Ran out of memory allocating page.\n");
        exit(-1);
    }
    page->type = type;
    free(page->fLinkHashTable);
    page->fLinkHashTable = NULL;
    return page;
}
```

---

### 11.23.27 main

Insert the special button page types into the page hash table.

— **hypertex** —

```
void makeSpecialPages(HashTable *pageHashTable) {
    hashInsert(pageHashTable,
        (char *)makeSpecialPage(Quitbutton, "QuitPage"),
        "QuitPage");
    hashInsert(pageHashTable,
        (char *)makeSpecialPage(Returnbutton, "ReturnPage"),
        "ReturnPage");
    hashInsert(pageHashTable,
        (char *)makeSpecialPage(Upbutton, "UpPage"),
        "UpPage");
}
```

---

### 11.23.28 addDependencies

Here is where I put the item into the pages linked list. Parse the `\bound{varlist}` command, and add vars to dependency table.

— **hypertex** —

```
void addDependencies(void) {
    TextNode *bound_node = curr_node;
    TextNode *node;
    SpadcomDepend *depend;
    if (cur_spadcom == NULL) {
        fprintf(stderr, "(HyperDoc) \\bound occuring outside a \\spadcom\n");
        printPageAndFilename();
        exit(-1);
    }
}
```

```

    }
    curr_node->type = Bound;
    curr_node->data.node = allocNode();
    curr_node = curr_node->data.node;
    getExpectedToken(Lbrace);
    parseHyperDoc();
    curr_node->type = Endarg;
    curr_node = bound_node;
    if (gPageBeingParsed->depend_hash == NULL) {
        gPageBeingParsed->depend_hash =
            (HashTable *) malloc(sizeof(HashTable), "Hash Table");
        hashInit(
            gPageBeingParsed->depend_hash,
            DependHashSize,
            (EqualFunction) stringEqual,
            (HashcodeFunction) stringHash);
    }
    for (node = bound_node->data.node;
        node->type != Endarg;
        node = node->next) {
        if (node->type == Word) {
            depend =
                (SpadcomDepend *) malloc(sizeof(SpadcomDepend), "SpadcomDepend");
            depend->label = allocString(node->data.text);
            depend->spadcom = cur_spadcom;
            depend->executed = 0;
            hashInsert(gPageBeingParsed->depend_hash, (char *)depend,
                depend->label);
        }
    }
}

```

### 11.23.29 isNumber

Returns true iff the TextNode contains a single integer.

— **hypertex** —

```

int isNumber(char * str) {
    char *s;
    for (s = str; *s != '\0'; s++) {
        if (!(isdigit(*s) || *s == '-'))
            return 0;
    }
    return 1;
}

```

### 11.23.30 parserError

This procedure is called by the parser when an error occurs. It prints the error message, followed by the next 10 tokens to ease finding the error for the user.

— **hypertext** —

```
void parserError(char *str) {
    int i, v;
    fprintf(stderr, " %s\n", str);
    fprintf(stderr, "Here are the next 10 tokens:\n");
    for (i = 0; i < 10; i++) {
        v = getToken();
        if (v == EOF)
            break;
        printToken();
    }
    fprintf(stderr, "\n");
    exit(-1);
}
```

—————

### 11.23.31 getFilename

Advance token to the next token in the input stream.

— **hypertext** —

```
int getFilename(void) {
    int c, ws;
    static int seen_white = 0; /*UNUSED */
    static char buffer[256];
    char *buf = buffer;
    if (last_token) {
        last_token = 0;
        return 0;
    }
    do {
        keyword_fpos = fpos;
        c = getChar();
        ws = whitespace(c);
        if (ws)
            seen_white = 1;
    } while (ws);
    switch (c) {
        case EOF:
            fprintf(stderr,
                "(HyperDoc) Error trying to read %s, unexpected end-of-file.\n",
                dbFileName);
            exit(-1);
        case '%':
        case '\\':
        case '{':
        case '}':
```

```

        fprintf(stderr, "(HyperDoc) Error unexpected character %c.\n",c);
        exit(-1);
    default:
        do {
            *buf++ = c;
        } while ((c = getChar()) != EOF && !filedelim(c));
        ungetChar(c);
        *buf = '\0';
        token.type = Word;
        token.id = buffer;
        seen_white = 0;
        break;
    }
    return 1;
}

```

---

### 11.23.32 getInputString

— hypertex —

```

char *getInputString(void) {
    char *string;
    TextNode *string_node,*save_node;
    save_node = curr_node;
    /* Get the nodes that make up the string */
    string_node = allocNode();
    curr_node = string_node;
    parseHyperDoc();
    curr_node->type = Endarg;
    /* Once here we print to string to get the actual name */
    string = printToString(string_node);
    freeNode(string_node, 0);
    curr_node=save_node;
    return string;
}

```

---

### 11.23.33 getWhere

Tries to determine if there is an optional argument for where I should be parsing from. If so it then tries to determine which.

— hypertex —

```

int getWhere(void) {
    int tw;
    getToken();
    if (token.type != Word)
        return -1;
}

```

```

/* Now try to determine if it is a good type */
if (!strcmp(token.id, "lisp")) {
    tw = FromSpadSocket;
}
else if (!strcmp(token.id, "unix")) {
    tw = FromUnixFD;
}
else if (!strcmp(token.id, "ht")) {
    tw = FromFile;
}
else {
    return -1;
}
/* now check to see if I got a closing square brace */
getToken();
if (token.type != Rsquarebrace)
    return -1;
return tw;
}

```

---

### 11.23.34 findFp

— hypertext —

```

FILE *findFp(FilePosition fp) {
    FILE *lfile;
    char fullname[256], addname[256];
    int ret_val;
    /* find the source file in the file hash table, if not there, open it */
    lfile = (FILE *) hashFind(&gFileHashTable, fp.name);
    if (lfile == NULL) {
        lfile = htFileOpen(fullname, addname, fp.name);
        hashInsert(&gFileHashTable, (char *)lfile, fp.name);
    }
    /* seek to beginning fp.pos */
    ret_val = fseek(lfile, fp.pos, 0);
    if (ret_val == -1) {
        perror("fseeking to a page");
        longjmp(jmpbuf, 1);
    }
    /* now set some global values */
    page_start_fpos = fp.pos;
    line_number = fp.ln;
    return lfile;
}

```

---

## 11.24 Handle InputString, SimpleBox, RadioBox input

### 11.24.1 makeInputWindow

— hypertext —

```
HyperLink *makeInputWindow(InputItem * item) {
    HyperLink *link;
    XSetWindowAttributes at;
    if (!make_input_file) {
        link = (HyperLink *) malloc(sizeof(HyperLink), "HyperLink");
        if (link == NULL) {
            fprintf(stderr, "Ran out of memory allocating a hyper link!\n");
            exit(-1);
        }
        at.cursor = gActiveCursor;
        at.background_pixel = gInputBackgroundColor;
        at.border_pixel = gActiveColor;
        link->win =
            XCreateWindow(gXDisplay, gWindow->fDisplayedWindow, 0, 0, 100, 100, 0,
                          0, InputOutput, CopyFromParent,
                          CWCursor | CWBackPixel | CWBorderPixel, &at);
        XSelectInput(gXDisplay, link->win, ButtonPressMask);
        link->type = Inputstring;
        link->x = link->y = 0;
        /** This way when I click in an input window, I need only use reference
            to get a pointer to the item                                     ***/
        link->reference.string = item;
        hashInsert(gLinkHashTable, (char *) link, (char *) &link->win);
        return link;
    }
    return 0;
}

/* create an unmapped input window for boxes */
```

—————

### 11.24.2 makeBoxWindow

— hypertext —

```
HyperLink *makeBoxWindow(InputBox * box, int type) {
    HyperLink *link = 0;
    XSetWindowAttributes at;
    if (!make_input_file) {
        link = (HyperLink *) malloc(sizeof(HyperLink), "makeBoxWindow");
        if (link == NULL) {
            fprintf(stderr, "Ran out of memory allocating a hyper link!\n");
            exit(-1);
        }
        at.cursor = gActiveCursor;
```

```

    at.background_pixel = gInputBackgroundColor;
    link->win = XCreateWindow(gXDisplay, gWindow->fDisplayedWindow,
                            0, 0, 100, 100, 0,
                            0, InputOutput, CopyFromParent,
                            CWCursor | CWBackPixel, &at);
    XSelectInput(gXDisplay, link->win, ButtonPressMask);
    link->type = type;
    link->x = link->y = 0;
    /** This way when I click in an input window, I need only use reference
        to get a pointer to the item                                     ***/
    link->reference.box = box;
    hashInsert(gLinkHashTable, (char *)link, (char *) &link->win);
}
return link;
}

```

### 11.24.3 initializeDefault

— hypertext —

```

void initializeDefault(InputItem *item, char * buff) {
    LineStruct *newline;
    LineStruct *curr_line;
    int size = item->size;
    int bp;
    item->curr_line = item->lines = allocInputline(size);
    curr_line = item->lines;
    item->num_lines = 1;
    curr_line->line_number = 1;
    /* while I still have lines to fill */
    for (bp = 0; *buff;) {
        if (*buff == '\n') {
            curr_line->len = bp;
            curr_line->buffer[bp] = 0;
            newline = allocInputline(size);
            newline->line_number = ++(item->num_lines);
            curr_line->next = newline;
            newline->prev = curr_line;

    curr_node->type = Endspadcommand;
    cur_spadcom = NULL;
    spad_node->link = makeLinkWindow(spad_node->next, spad_node->type, 1);
    gInButton--;
}

```

---

#### 11.26.15 parseSpadsrc

— hypertex —

```

void parseSpadsrc(TextNode *spad_node) {
    char buf[512], *c = buf;
    int ch, start_opts = 0;
    /*TextNode *node = NULL;*/
    example_number++;
    gInButton++;
    gInSpadsrc++;
    spad_node->type = Spadsrc;
    spad_node->space = token.id[-1];
    cur_spadcom = curr_node;
    spad_node->next = allocNode();
    curr_node = spad_node->next;
    do {
        ch = getChar();
        if (ch == ']')
            start_opts = 0;
        if (start_opts)
            *c++ = ch;
        if (ch == '[')
            start_opts = 1;
    } while (ch != '\n');
    *c = '\0';
    parseVerbatim(Spadsrcctx);
    parseFromString(buf);
    curr_node->type = Endspadsrc;
    cur_spadcom = NULL;
    spad_node->link = makeLinkWindow(spad_node->next, Spadsrc, 1);
    gInButton--;
    gInSpadsrc--;
}

```

---

### 11.26.16 parseEnv

— hypertext —

```

void parseEnv(TextNode *node) {
    char *env;
    char buff[256];
    char *buff_pntr = &buff[1];
    int noEnv = 0;
    getExpectedToken(Lbrace);
    getExpectedToken(Word);
    env = getenv(token.id);
    if (env == NULL) {
        /** The environment variable was not found **/
        fprintf(stderr,
            "(HyperDoc) Warning: environment variable \'%s\' was not found.\n",
            token.id);
        env = halloc(1, "string");
        env[0] = '\0';
    }
}

```

```

        noEnv = 1;
    }
    buff[0] = token.id[-1];
    strcpy(buff_ptr, env);
    if (noEnv)
        free(env);
    node->data.text = allocString(buff_ptr);
    node->type = Word;
    getExpectedToken(Rbrace);
}

```

---

### 11.26.17 parseValue1

This parseValue routine accepts an empty {} but makes it a zero instead of a one. Thus \indent{} is equivalent to \indent{0}.

— **hypertex** —

```

void parseValue1(void) {
    TextNode *value_node, *ocn = curr_node;
    char *s;
    curr_node->type = token.type;
    curr_node->space = token.id[-1];
    value_node = allocNode();
    value_node->type = Word;
    curr_node->data.node = value_node;
    getExpectedToken(Lbrace);
    s = getInputString();
    if (!isNumber(s)) {
        fprintf(stderr,
            "Parser Error: parse for value was expecting a numeric value\n");
        strcpy(value_node->data.text, "0");
    }
    else {
        value_node->data.text = allocString(s);
    }
    curr_node = ocn;
}

```

---

### 11.26.18 parseValue2

This command accepts an empty argument command. Thus \space{} is equivalent to \space{1}

— **hypertex** —

```

void parseValue2(void) {
    TextNode *value_node, *ocn = curr_node;
    char *s;
    curr_node->type = token.type;

```

```

curr_node->space = token.id[-1];
value_node = allocNode();
value_node->type = Word;
curr_node->data.node = value_node;
getExpectedToken(Lbrace);
s = getInputString();
if (!isNumber(s)) {
    fprintf(stderr,
        "Parser Error: parse for value was expecting a numeric value\n");
    strcpy(value_node->data.text, "1");
}
else {
    value_node->data.text = allocString(s);
}
curr_node = ocn;
}

```

### 11.26.19 parseTable

Parse a \table command.

— **hypertex** —

```

void parseTable(void) {
    TextNode *tn = curr_node;
    if (gParserMode != AllMode) {
        curr_node->type = Noop;
        fprintf(stderr, "Parser Error token %s unexpected\n",
            token_table[token.type]);
        longjmp(jmpbuf, 1);
    }
    curr_node->type = Table;
    getExpectedToken(Lbrace);
    curr_node->next = allocNode();
    curr_node = curr_node->next;

## 11.27 Reading bitmaps

### 11.27.1 HTReadBitmapFile

This file was produced by J.M. Wiley with some help from the bitmap editor routine. It reads in a bitmap file, and calls XCreatePixmapFromBitmapData to transform it into a Pixmap. He did this because the routine XReadBitmapFile does not seem to work too well (whatever that means).

— **hypertex** —

```
XImage *HTReadBitmapFile(Display *display,int screen,char * filename,
                        int *width, int *height) {
    XImage *image;
    FILE *fd;
    char Line[256], Buff[256];
    int num_chars;
    char *ptr;
    int rch;
    int version;
    int padding, chars_line, file_chars_line, file_chars;
    int bytes;
    int x_hot, y_hot;
    image = XCreateImage(display, DefaultVisual(display, screen), 1,
                        XYBitmap, 0, NULL, 0, 0, 8, 0);
    (image)->byte_order = LSBFirst; /* byte_order */
    (image)->bitmap_unit = 8; /* bitmap-unit */
    (image)->bitmap_bit_order = LSBFirst; /* bitmap-bit-order */
    if (!(fd = zzopen(filename, "r"))) {
        fprintf(stderr, "ReadBitmapFile: File >%s< not found\n", filename);
        exit(-1);
    }
    /*
     * Once it is open, lets get the width and height
     */
    if ((readWandH(fd,(unsigned int *)width,(unsigned int *) height)) < 0) {
        fprintf(stderr, "ReadBitmapFile: Bad file format in %s\n", filename);
        exit(-1);
    }
    /*
     * Now get the next line, and see if it is hot spots or bits
     */
    if (fgets(Line, MAXLINE, fd) == NULL) {
        fprintf(stderr, "ReadBitmapFile: Bad file format in %s\n", filename);
        exit(-1);
    }
    /*
     * Now check the first character to see if it is a # or an s
     */
    if (Line[0] == '#') {
        if ((readHot(fd, Line, &x_hot, &y_hot)) < 0) {
            fprintf(stderr, "ReadBitmapFile: Bad file format in %s\n", filename);
            exit(-1);
        }
    }
}
```

```

(image)->width = *width;
(image)->height = *height;
/*
 * figure out what version
 */

        if (!padding || ((bytes + 2) % file_chars_line))
            *(ptr++) = rch >> 8;
    }
else
    for (bytes=0, ptr = (image)->data; bytes < file_chars; bytes++, ptr++) {
        if (fscanf(fd, " 0x%x%*[,}]%*[\n]", &rch) != 1) {
            fprintf(stderr, "ReadBitmapFile: Bad file format in %s\n", filename);
            exit(-1);
        }
        *ptr = rch;
    }
fclose(fd);
return image;
}

```

---

### 11.27.2 readHot

— hypertext —

```
static int readHot(FILE *fd, char Line[], int *x_hot, int *y_hot) {
    char Buff[256];
    /*
     * Works much the same as get width and height, just new variables
     */
    if (sscanf(Line, "#define %s %d", Buff, x_hot) != 2)
        return -1;
    if (fgets(Line, MAXLINE, fd) == NULL)
        return -1;
    if (sscanf(Line, "#define %s %d", Buff, y_hot) != 2)
        return -1;
    if (fgets(Line, MAXLINE, fd) == NULL)
        return -1;
    return 1;
}
```

---

### 11.27.3 readWandH

— hypertext —

```
static int readWandH(FILE *fd, unsigned int *width, unsigned int *height) {
    char Line[256], Buff[256];
    if (fgets(Line, MAXLINE, fd) == NULL)
        return -1;
    /*
     * Once we have the line, scan it for the width
     */
    if (sscanf(Line, "#define %s %d", Buff, width) != 2)
        return -1;
    /*
     * Hopefully we have the width, now get the height the same way
     */
    if (fgets(Line, MAXLINE, fd) == NULL)
        return -1;
    /*
     * Once we have the line, scan it for the height
     */
    if (sscanf(Line, "#define %s %d", Buff, height) != 2)
        return -1;
    return 1;
}
```

---

### 11.27.4 insertImageStruct

Read a bitmap file into memory.

— hypertex —

```
ImageStruct *insertImageStruct(char *filename) {
    int bm_width, bm_height;
    XImage *im;
    ImageStruct *image;
    if (*filename == ' ')
        filename++;
    if ((image=(ImageStruct *) hashFind(&gImageHashTable, filename)) == NULL) {
        im = HTReadBitmapFile(gXDisplay, gXScreenNumber, filename,
                               &bm_width, &bm_height);

        /*
         * now add the image to the gImageHashTable
         */
        image = (ImageStruct *) malloc(sizeof(ImageStruct), "ImageStruct");
        image->image.xi = im;
        image->width = image->image.xi->width;
        image->height = image->image.xi->height;
        image->filename = (char *) malloc(sizeof(char) * strlen(filename) + 1,
                                           "insert_image--filename");
        /* strcpy(image->filename, filename); */
        sprintf(image->filename, "%s", filename);
        hashInsert(&gImageHashTable, (char *) image, image->filename);
    }
    return image;
}
```

—————

## 11.28 Scrollbar handling routines

The scrollbar is displayed on the side of the HyperDoc display, if needed. It is composed of four windows

- fScrollUpWindow – the arrowed box at the top of the scrollbar. Scrolls the window up a line at a time.
- fScrollDownWindow – Located at the bottom of the window, it is used to scroll down a single line at a time.
- scrollbar – this is the window which does the variable scrolling. It houses the actual scroller.
- scroller – This is the scroller inside the scroll bar.

The procedure below, makes all these windows, and also makes three bitmaps,

- sup – The up arrow for the fScrollUpWindow.
- sdown – the down arrow for the fScrollDownWindow.
- scroller – the scroller stipple.

It then fills the window with the proper Pixmap background.

The scrollbar and scroller works as follows. The size of the scroller is calculated as

$$\frac{\text{size of scroller}}{\text{size of scrollbar}} = \frac{\text{size of visible text}}{\text{size of whole scrolling region}} .$$

The top of the scroller shows the relative position in the page of the top of the scrolling region. This way the user knows how far down the page he or she has moved. When the user clicks in the scrollbar, the center of the scroller, if possible, is placed at the point of the click.

See the routines

- showScrollBars – to see how the scroll bars are actually realized.
- moveScroller – to see how the scroller is moved when the user scrolls

### 11.28.1 makeScrollBarWindows

— hypertext —

```
void makeScrollBarWindows(void) {
    XSetWindowAttributes at;
    at.cursor = gActiveCursor;
    at.event_mask = ButtonPress;

/*
 * Now we map the windows, since the bitmaps are the backgrounds for the
 * windows, we need to worry about redrawing them.
 */
XMapWindow(gXDisplay, hdWindow->fScrollUpWindow);
XMapWindow(gXDisplay, hdWindow->fScrollDownWindow);
XMapWindow(gXDisplay, hdWindow->scrollbar);
XMapWindow(gXDisplay, hdWindow->scroller);
drawScroller3DEffects(hdWindow, 0, 0, wc.width, wc.height);
}

```

```

/*****

Moves the scroller to its proper place within the scrollbar. It
calculates how far down the page we are, and then moves the scroller
accordingly

*****/

```

\_\_\_\_\_

#### 11.28.4 moveScroller

Moves the scroller to its proper place.

— **hypertex** —

```

void moveScroller(HDWindow * hdWindow) {
    XWindowChanges wc;
    int t = (int) (hdWindow->fScrollBarHeight * (-hdWindow->page->scroll_off));
    hdWindow->fScrollerTopPos = (int) (t / hdWindow->page->scrolling->height);
    wc.x = 0;
    wc.y = hdWindow->fScrollerTopPos;
    wc.width = supwidth;
    wc.height = hdWindow->fScrollerHeight;
    XConfigureWindow(gXDisplay, hdWindow->scroller,
                     CWX | CWY | CWHeight | CWWidth,
                     &wc);
    drawScroller3DEffects(hdWindow, 0, 0, wc.width, wc.height);
}

```

\_\_\_\_\_

#### 11.28.5 drawScrollLines

Checks the pageFlags to see if we need a top, or a bottom line. These are the horizontal lines framing a scrolling region when the scrolling region is not the entire window.

— **hypertex** —

```

void drawScrollLines(void) {
    if (!(gWindow->page->pageFlags & NOLINES)) {
        lineTopGroup();
        if (gWindow->page->header->height) {
            XDrawLine(gXDisplay, gWindow->fMainWindow, gWindow->fStandardGC,
                      0,
                      gWindow->page->top_scroll_margin -
                      tophalf(gWindow->border_width) -
                      2 * scroll_top_margin,
                      gWindow->scrollwidth,
                      gWindow->page->top_scroll_margin -
                      tophalf(gWindow->border_width) -
                      2 * scroll_top_margin);
        }
        if (gWindow->page->footer->height) {
            XDrawLine(gXDisplay, gWindow->fMainWindow, gWindow->fStandardGC,
                      0,
                      gWindow->page->bot_scroll_margin +
                      bothalf(gWindow->border_width) - 1,
                      gWindow->scrollwidth,
                      gWindow->page->bot_scroll_margin +
                      bothalf(gWindow->border_width) - 1);
        }
        popGroupStack();
    }
}

```

### 11.28.6 calculateScrollBarMeasures

Calculates all the measures for the scrollbars.

— **hypertext** —

```

### 11.29.3 showPaste

— hypertext —

```

static void showPaste(TextNode *node) {
    PasteNode *paste;
    if (!(paste = (PasteNode *) hashFind(gWindow->fPasteHashTable,
        node->data.text)))
        return;
    /*
     * Once I have got this far, then I had better save the current group
     * stack and the item stack
     */
    if (paste->group)
        freeGroupStack(paste->group);
    paste->group = (GroupItem *) copyGroupStack();
    if (paste->item_stack)
        freeItemStack(paste->item_stack);
    paste->item_stack = (ItemStack *) copyItemStack();
}

```

---

### 11.29.4 showPastebutton

— hypertext —

```

static void showPastebutton(TextNode *node) {

```

```

XWindowChanges wc;
pushActiveGroup();
wc.x = node->x;
wc.y = node->y - node->height + yOff + gRegionOffset;
wc.height = node->height;
wc.width = node->width - trailingSpace(node->next);
#ifdef DEBUG
    fprintf(stderr, "Configure in showLink %d %d %d %d\n",
               wc.x, wc.y, wc.width, wc.height);
#endif
XConfigureWindow(gXDisplay, node->link->win,
                 CWX | CWY | CWHeight | CWWidth, &wc);
XMapWindow(gXDisplay, node->link->win);
}

```

---

### 11.29.5 showInput

Display an input string window.

— **hypertex** —

```

static void showInput(TextNode *node) {
    XWindowChanges wc;
    InputItem *item;
    char *inpbuffer;
    item = node->link->reference.string;
    inpbuffer = item->curr_line->buffer;
    wc.border_width = 0;
    wc.x = node->x;
    wc.y = node->y + gRegionOffset + yOff - node->height + 2;
    wc.height = node->height - 2;
    wc.width = node->width;
    if (pix_visible(node->y, node->height)) {
        XConfigureWindow(gXDisplay, node->link->win,
                        CWX | CWY | CWHeight | CWWidth | CWBorderWidth,
                        &wc);
        XMapWindow(gXDisplay, node->link->win);
    }
    XFlush(gXDisplay);
    drawInputsymbol(item);
}

```

---

### 11.29.6 showSimpleBox

— **hypertex** —

```

static void showSimpleBox(TextNode *node) {
    XWindowChanges wc;

```

```

InputBox *box;
/* first configure the box size properly */
box = node->link->reference.box;
wc.x = node->x;
wc.y = node->y + gRegionOffset + yOff - node->height;
wc.height = ((box->picked) ?
              (box->selected->height) : (box->unselected->height));
wc.width = node->width;
if (visible(node->y + gTopOfGroupStack->cur_font->ascent, node->height)) {
    XConfigureWindow(gXDisplay, node->link->win,
        CWX | CWY | CWHeight | CWWidth, &wc);
    XMapWindow(gXDisplay, node->link->win);
    if (box->picked)
        pick_box(box);
    else
        unpick_box(box);
}
}

```

---

### 11.29.7 showSpadcommand

Display a spad command node.

— **hypertex** —

```

static void showSpadcommand(TextNode *node) {
    XWindowChanges wc;
    gInAxiomCommand = 1;
    pushSpadGroup();
    wc.x = node->x;
    if (node->type == Spadsrc)
        wc.y = node->y + gRegionOffset + yOff - 2 * node->height;
    else
        wc.y = node->y + gRegionOffset + yOff - node->height;
    wc.height = node->height;
    wc.width = node->width;
#ifdef DEBUG
    fprintf(stderr, "Spadcommand configured %d x %d -- (%d, %d)\n",
        wc.width, wc.height, wc.x, wc.y);
#endif
    XConfigureWindow(gXDisplay, node->link->win,
        CWX | CWY | CWHeight | CWWidth, &wc);
    XMapWindow(gXDisplay, node->link->win);
}

```

---

### 11.29.8 showImage

Display a pixmap.

— **hypertex** —

```

static void showImage(TextNode *node, GC gc) {
    int src_x, src_y, src_width, src_height, dest_x, dest_y, ret_val;
    if (!pix_visible(node->y, node->height))
        return;
    if (node->image.xi == NULL)
        return;
    dest_x = node->x;
    src_x = 0;
    src_y = 0;
    dest_y = node->y + gRegionOffset - node->height + yOff;
    need_scroll_up_button = 1;
    if (node->width > (right_margin - node->x))
        src_width = right_margin - node->x;
    else
        src_width = node->width;

    if (gDisplayRegion != Scrolling) {
        src_y = 0;
        src_height = node->image.xi->height;
    }
    else {
        /* I may have only a partial image */
        if (dest_y < 0) { /* the top is cut off */
            src_y = -dest_y;
            dest_y = 0;
            src_height = node->image.xi->height - src_y;
        }
        else if (dest_y + node->image.xi->height > gWindow->scrollheight) {
            /* the bottom is cut off */
            src_y = 0;
            src_height = gWindow->scrollheight - dest_y;
        }
        else { /* the whole thing is visible */
            src_y = 0;
            src_height = node->image.xi->height;
        }
    }
    ret_val = XPutImage(gXDisplay, gWindow->fDisplayedWindow, gc,
        node->image.xi, src_x, src_y, dest_x, dest_y,
        src_width, src_height);
    switch (ret_val) {
        case BadDrawable:
            fprintf(stderr, "(HyperDoc: showImage) bad drawable\n");
            break;
        case BadGC:
            fprintf(stderr, "(HyperDoc: showImage) bad GC");
            break;
        case BadMatch:

            break;
        case BadValue:
            fprintf(stderr, "(HyperDoc: showImage) bad value");
            break;
    }
}

```

}

---

## 11.30 Axiom communication interface

Still a problem with closeClient.

### 11.30.1 issueSpadcommand

Issue a AXIOM command to the buffer associated with a page.

— **hypertex** —

```
void issueSpadcommand(HyperDocPage *page, TextNode *command,
                     int immediate, int type) {
    char *buf;
    int ret_val;
    ret_val = connectSpad();
    if (ret_val == NotConnected || ret_val == SpadBusy)
        return;
    if (page->sock == NULL)
        startUserBuffer(page);
    ret_val = send_int(page->sock, TestLine);
    if (ret_val == -1) {
        page->sock = NULL;
        clearExecutionMarks(page->depend_hash);
        issueSpadcommand(page, command, immediate, type);
        return;
    }
    issueDependentCommands(page, command, type);
    ret_val = send_int(page->sock, ReceiveInputLine);
    buf = printToString(command);
    if (immediate) {
        buf[strlen(buf) + 1] = '\0';
        buf[strlen(buf)] = '\n';
    }
    if (type == Spadsrc)
        sendPile(page->sock, buf);
    else
        send_string(page->sock, buf);
    markAsExecuted(page, command, type);
    gIsEndOfOutput = 0;
}
```

---

### 11.30.2 sendPile

— **hypertex** —

```
static void sendPile(Socket *sock, char * str) {
    FILE *f;
    char name[512], command[512];
    sprintf(name, "/tmp/hyper%s.input", getenv("SPADNUM"));
    f = fopen(name, "w");
    if (f == NULL) {
        fprintf(stderr, "Can't open temporary input file %s\n", name);
        return;
    }
    fprintf(f, "%s", str);
    fclose(f);
    sprintf(command, "read %s\n", name);
    send_string(sock, command);
}
```

### 11.30.3 issueDependentCommands

— hypertex —

```

static void issueDependentCommands(HyperDocPage *page,
                                   TextNode *command,int type) {
    TextNode *node, *depend_label;
    SpadcomDepend *depend;
    int endType = (type == Spadcommand || type == Spadgraph) ?
        (Endspadcommand) : (Endspadsrc);
    for (node = command->next; node->type != endType;
         node = node->next)
        if (node->type == Free)
            for (depend_label = node->data.node; depend_label != NULL;
                 depend_label = depend_label->next)
                if (depend_label->type == Word) {
                    depend = (SpadcomDepend *)
                        hashFind(page->depend_hash, depend_label->data.text);
                    if (depend == NULL) {
                        fprintf(stderr,
                            "Error: dependency on undefined label: %s\n",
                            depend_label->data.text);
                        continue;
                    }
                }
            if (!depend->executed) {
                issueSpadcommand(page, depend->spadcom->next, 1,
                                depend->spadcom->type);
                while (!gIsEndOfOutput)
                    pause();
                sleep(1);
            }
        }
    }
}

```

### 11.30.4 markAsExecuted

— **hypertex** —

```
static void markAsExecuted(HyperDocPage *page, TextNode *command, int type) {
    TextNode *node, *depend_label;
    SpadcomDepend *depend;
    int endType = (type == Spadcommand || type == Spadgraph)
        ? (Endspadcommand) : (Endspadsrc);
    for (node = command; node->type != endType; node = node->next)
        if (node->type == Bound)
            for (depend_label = node->data.node; depend_label != NULL;
                depend_label = depend_label->next)
                if (depend_label->type == Word) {
                    depend = (SpadcomDepend *)
                        hashFind(page->depend_hash, depend_label->data.text);
                    if (depend == NULL) {
                        fprintf(stderr, "No dependency entry for label: %s\n",
                            depend_label->data.text);
                        continue;
                    }
                    depend->executed = 1;
                }
    }
}
```

—————

### 11.30.5 startUserBuffer

Start a spad buffer for the page associated with the give.

— **hypertex** —

```
static void startUserBuffer(HyperDocPage *page) {
    char buf[1024], *title;
    char *SPAD;
    char spadbuf[250];
    char complfile[250];
    int ret_val;
    SPAD = (char *) getenv("AXIOM");
    if (SPAD == NULL) {
        sprintf(SPAD, "/spad/mnt/rios");
    }
    sprintf(spadbuf, "%s/lib/spadbuf", SPAD);
    sprintf(complfile, "%s/lib/command.list", SPAD);
    title = printToString(page->title);
    if (access(complfile, R_OK) == 0)
        /*
         * TTT says : why not invoke with "-name axiomclient" and set any
         * defaults in the usual way
         */
#ifdef RIOSplatform
        sprintf(buf,
```

```

        "aixterm -sb -sl 500 -name axiomclient -n '%s' -T '%s' -e %s %s %s&",
        title, title, spadbuf, page->name, complfile);
    else
        sprintf(buf,
            "aixterm -sb -sl 500 -name axiomclient -n '%s' -T '%s' -e %s %s&",
            title, title, spadbuf, page->name);
#else
#ifdef SUNplatform
    sprintf(buf,
        "xterm -sb -sl 500 -name axiomclient -n '%s' -T '%s' -e %s %s %s&",
        title, title, spadbuf, page->name, complfile);
    else
        sprintf(buf,
            "xterm -sb -sl 500 -name axiomclient -n '%s' -T '%s' -e %s %s&",
            title, title, spadbuf, page->name);
#else
    sprintf(buf,
        "xterm -sb -sl 500 -name axiomclient -n '%s' -T '%s' -e %s %s %s&",
        title, title, spadbuf, page->name, complfile);
    else
        sprintf(buf,
            "xterm -sb -sl 500 -name axiomclient -n '%s' -T '%s' -e %s '%s'&",
            title, title, spadbuf, page->name);
#endif
#endif
    ret_val = system(buf);
    if (ret_val == -1 || ret_val == 127) {
        /*
         * perror("running the xterm spadbuf program"); exit(-1);
         */
    }
    acceptMenuServerConnection(page);
    sleep(2);
}

```

—————

### 11.30.6 clearExecutionMarks

Clears the execution marks in a hash table when a buffer has been killed.

— **hypertext** —

```

static void clearExecutionMarks(HashTable *depend_hash) {
    int i;
    HashEntry *h;
    SpadcomDepend *depend;
    if (depend_hash == 0)
        return;
    for (i = 0; i < depend_hash->size; i++)
        for (h = depend_hash->table[i]; h != NULL; h = h->next) {
            depend = (SpadcomDepend *) h->data;
            depend->executed = 0;
        }
}

```

---

}

### 11.30.7 acceptMenuConnection

— hypertext —

```

Sock *acceptMenuConnection(Sock *server_sock) {
    int sock_fd;
    Sock_List *pls;
    /* Could only be InterpWindow */
    pls = (Sock_List *) hallocc(sizeof(Sock_List), "SockList");
    sock_fd = accept(server_sock->socket, 0, 0);
    if (sock_fd == -1) {
        perror("session : accepting connection");
        return 0;
    }
    (pls->Socket).socket = sock_fd;
    get_socket_type((Sock *) pls);
#ifdef DEBUG
    fprintf(stderr,
        "session: accepted InterpWindow , fd = %d\n", sock_fd);
#endif
    /* put new item at head of list */
    if (plSock == (Sock_List *) 0) {
        plSock = pls;
        plSock->next = (Sock_List *) 0;
    }
    else {
        pls->next = plSock;
        plSock = pls;
    }
    /* need to maintain socket_mask since we roll our own accept */
    FD_SET(plSock->Socket.socket, &socket_mask);
    return (Sock *) plSock;
}

```

---

### 11.30.8 acceptMenuServerConnection

TTT thinks this code should just provide a Sock to the page. The only client assumed is a spadbuf. Since spadbuf was invoked with the page name, it just passes it back here as a check (get\_string line).

— hypertext —

```

static void acceptMenuServerConnection(HyperDocPage *page) {
    int ret_code/*, i*/;
    fd_set rd;
    Sock *sock;

```

```

char *buf_name;
HyperDocPage *npage;
if (page->sock != NULL)
    return;
while (1) {
    rd = server_mask;
    ret_code = sselect(FD_SETSIZE, &rd, 0, 0, NULL);
    if (ret_code == -1) {
        perror("Session manager select");
        continue;
    }
    if (server[1].socket > 0 && FD_ISSET(server[1].socket, &rd)) {
        sock = acceptMenuConnection(server + 1);
        if (sock == 0)
            return;
        if (sock->purpose == InterpWindow) {
            buf_name = get_string(sock);
            npage = (HyperDocPage *)
                hashFind(gWindow->fPageHashTable, buf_name);
            if (npage == NULL) {
                /*
                 * Lets just try using the current page TTT doesn't know
                 * why this could be detrimental
                 *
                 * fprintf(stderr, "connecting spadbuf to unknown page:
                 * %s\n", buf_name);
                 */
                page->sock = sock;
                return;
            }
            else {
                /*
                 * For some reason npage and page may be different TTT
                 * thinks this happens when a dynamic page has the same
                 * name as an existing static page.
                 */
                npage->sock = sock;
                page->sock = sock;
            }
            if (!strcmp(buf_name, page->name)) {
                return;
            }
        }
    }
}
}
}
}

```

---

### 11.30.9 printToString

This routine takes a text node and creates a string out of it. This is for use with things such as spad commands. There are a very limited set of node types it can handle, so be careful.

— **hypertext** —

```
char *printToString(TextNode *command) {
    int len = 0;
    printToString1(command, &len);
    p2sBuf = resizeBuffer(len, p2sBuf, &p2sBufSize);
    return printToString1(command, NULL);
}
```

---

### 11.30.10 printToString1

— **hypertext** —

```
char *printToString1(TextNode *command, int * sizeBuf) {
    char *c = p2sBuf;
    char *s;
    InputItem *item;
    LineStruct *curr_line;
    int lcount;
    InputBox *box;
    int num_spaces;
    int count;
    TextNode *node;
    /*
     * Init the stack of text nodes, things are pushed on here when I trace
     * through a nodes data.node. This way I always know where my next is.
     */
    for (node = command; node != NULL;) {
        switch (node->type) {
            case Newline:
                storeChar('\n');
                node = node->next;
                break;
            case Ifcond:
                if (checkCondition(node->data.ifnode->cond))
                    node = node->data.ifnode->thennode;
                else
                    node = node->data.ifnode->elsenode;
                break;
            case Endarg:
            case Endspadcommand:
            case Endspadsrc:
            case Endpix:
                storeChar('\0');
                return p2sBuf;
            case Endverbatim:
```

```

case Endif:
case Fi:
case Endmacro:
case Endparameter:
case Rbrace:
case Endgroup:
    node = node->next;
    break;

mainEventLoop();
/*      fprintf(stderr,"hyper:main:returned mainEventLoop\n");*/
return 0;
}

```

---

## Chapter 12

# The htsearch script

Construct a page with a menu of references to the word. The syntax of the command is:

```
htsearch word
```

— htsearch —

```
#!/bin/sh
```

```
htbindir=$AXIOM/lib
```

```
htpagedir=$AXIOM/doc
```

```
if test -z "$1"
```

```
then
```

```
    echo ""|$htbindir/presea case=1 -
```

```
else
```

```
( cd $htpagedir; $htbindir/hthits "$1" $htpagedir/ht.db | sort -r -n -k 1.22 | $htbindir/presea case=0 expr="$1"
```

```
fi
```

—————

## Chapter 13

# The presea script

This is part of 'presea' which is run on output of 'hthits'. 'hthits' outputs looks like:

```
\newsearchresultentry{1}{Asp24 Example Code}{Asp24ExampleCode}
\newsearchresultentry{1}{Asp27 Example Code}{Asp27ExampleCode}
....
```

after splitting on "{" the first field is '\newsearchresultentry' and the second is number of occurrences of search term in the page. The test for 'j >= 2' is just to tolerate garbage. presea is supposed to count the number of matches and put it in the header for search results. The previous version reported no matches in the header. This used to read:

```
a[n] = $0;
n=n+1;
j=split($0,b,"{");
m=m+substr(b[j],1,length(b[j])-1);
```

— presea —

```
#!/bin/awk -f
BEGIN {n=0;m=0}

{
    a[n] = $0;
    n=n+1;
    j=split($0,b,"{");
    if (j >= 2)
        m=m+substr(b[2],1,length(b[2])-1);
}

END {
    printf ("\\begin{page}{staticsearchpage}");
    if (case==1)
        printf ("{No matches found}\n")
    else if ( n==0 || m==0 )
        printf ("{No matches found for {\\em %s}}\n",expr)
    else
        printf ("{%d matches found in %d pages for {\\em %s}}\n",m,n,expr);
}
```

```

printf ("Matches\\tab{8}in Page\\n");
printf "\\beginscroll\\n";
printf "\\beginmenu\\n";
for(i=0;i<n;i++) printf ("%s\\n",a[i]);
printf "\\endmenu\\n";
printf "\\endscroll\\n";
printf "\\end{page}\\n";
}

```
